1. 299mhz fm mod

Yahoo group: de1103
Date: 2006-01-18 21:49:44 UTC
From: camteax
Topic: 1 Message: 1

Does anyone know anything about a mod that will result in the Kaito/Degen 1103 to be able to receive up 299mhz on the fm band. I'm not referring to 000khz to 29mhz am mod.

I think it "might be possible" since there was 300mhz software mod for some versions of the Kaito/Degen 1102. Also, on the other 1103 group, there's a photo of the 1103 tuned to 299.97mhz fm.

It might have been displaying that frequency, but I can't see the oscillator
going that high. The mixer is a simple balanced FET design and that won't
work at 299 Mhz, either.

Leon

I wouldn't find it useful, because the DE1103 has only wide FM, not narrow and has not squelch either.
In Italy, it is possible to listen to Police (!) with the DE1103 on 78 Mhz, but without narrow FM and squelch, it is really awkward.
If you are interested in VHF, you'd better stick to a hand-held scanner.
Fab

6. 21951 mod

Yahoo group: de1103
Date: 2006-01-19 17:36:03 UTC
From: morimoore
Topic: 6 Message: 6

When i punch in 21951 and press the band - and + keys i get err. Am i doing somthing wrong? I thought there was a bug that would let me scan from 00 to 2999.

7. Re: 21951 mod

Yahoo group: de1103
Date: 2006-01-19 18:32:18 UTC
From: Jim Hackett
Topic: 6 Message: 7

Not sure what you're saying but if you punch in 21951 then press band-
you will get an error BECAUSE, band- is for entering FM frequencies
which 21951 is NOT a valid FM frequency. Entering 21951 then band+ is
an acceptable entry because the band+ key is for AM.

If you are talking about entering 21951 then trying to use the +/- key
AFTER it's entered, it will work fine. At least it does on mine...

Here's the text from the other 1103 user group files section regarding the 000khz to 29mhz easter egg. Also, on the other 1103 user group files section, there's some other useful files.

DE-1103 Easter Egg: Tuning from 000 to 099 kHz

thank you engineer #21951! phil :)

STORING 000 kHz IN MEMORY "99":

1. retract fully the antenna
2. switch DX/LO to "LO" [aka attenuator on]

Note: step #1 and #2 reduce stopping during scanning

3. turn on the radio
4. enter: 21951 [BAND+]

Note: the display shows no square around any meter band

5. press and hold [BAND-] until downward scanning begins
6. wait for the display to read lower than 100 kHz

Note: this scan process will take about 14.5 minutes

7. press [Band+] to stop while tuned between 0 and 99 kHz

Note: if you go past simply press and hold [Band+]

8. turn the tuning dial until 000 kHz is displayed
9. enter: "99" STORE STORE

Note: now memory 99 has 000 kHz for future access

10. remember to switch DX/LO back to "DX"

FUTURE USAGE

1. enter: "99" [M/F] then press [M/F] again
2. turn the tuning dial upward from 000 kHz

OTHER USAGES

Storing other values into memory while in this mode allows continuous scanning up or down from those values as well.

Well, two immediate questions come to mind, with a third supplementing:

1. Are you sure of the frequency? Aussie regulators adhere to international FM assignment/usage... i.e the FM band is 88-108 MHz. Are you sure it's 152.2... mebbe it's 102.2 MHz?

2. Where is your listening location? If as your e-mail address suggests, you might be in India, there ain't a snowball's chance in hell of hearing an Australian FM tx.

3. If you do live in Oz, mebbe that station is in another city.

TD

P.S. Why do I think I've been we're being "had" on this problem?

Hi Brian:

Depending on where you live, you may get the signal of WWVB, the US time signal station on 60KHz, or the russian one on 66KHz. I also know that the UK has one, but I'm not sure of the frequency. Please note that these stations transmit no audio. They just vary the power output. The receivers that use these signals use the difference in signal strength to calibrate their timepieces.

17. 8th Russian Open DX Contest

Yahoo group: de1103
Date: 2006-01-21 09:07:17 UTC
From: Dmitry Mezin
Topic: 17 Message: 17

Hi all fans of DE1103,

All DXers of the world are invited to participate in the 8th Russian Open DX Contest, managed this year by me, Dmitry Mezin. Contest dates are 3-13 March 2006.

You may find the complete rules at
http://dxsignal.info/rodxc2006/rodxc06en.pdf.

Short description follows:

Part 1. Listening to ex-USSR states, as well as to limited number of stations from aroung the world
Part 2. Listening to Russian broadcasting outlets: both original stations and foreign relays via Russia
Part 3. Quiz of 20 radio-related questions.

All questions and comments are welcome to dxc2006@....

To get an idea of the former contests, you may browse their official pages,
http://dxsignal.info/rdxc2004/rdxc2004en.htm
http://dxsignal.info/rdxc2005/rdxc2005en.htm

And if someone can donate a good prize for the contest (we prefer DX books and CDs, no matter how cheap / old are they), please contact me at dxc2006@....

73, and good luck during the Contest,
Dmitry Mezin
Kazan, Russia

Hi Theo,
Thanks for the reply.
I am sure the frequency is correct.
Here is the web link of that list.
http://www.sikh.com.au/indiatoday/qradio.asp
In the above list the third # station that I am
talking about.
I live in 8/22 Homebush Road,Strathfield, Sydney, NSW
2135.
Please help me if it is possible to use 1103 for this
station.
Thank you very much,
Anil Patel

24. Kiwa Mods?

Yahoo group: de1103
Date: 2006-01-22 03:22:57 UTC
From: flathatter_fa18
Topic: 24 Message: 24

I posted this at the "other" DE1103 newsgroupconcerning the new Kiwa mods...and I'm reposting it here hoping that I can get additional helpful input:

Being a newbie to SWL I was unware that static discharge could damage components in the KA1103. Over the many months that I've owned the radio, I'm sure I must at one time have touched the whip after walking across a carpet with rubber-soled shoes...this seems like a pretty common occurence.

This maybe a simple question for the more experienced SWLs, but since I'm still learning the ropes, how would one know if the front end FET was damaged by a static discharge?

Thanks, in advance for any comments.

By your mention of ESPN Radio, I assume you are in the US or Canada.
The signal you're hearing on 69KHz (or probably 70KHz) is most likely
an image (station that appears on a frequency it's not supposed to be
heard on) of a nearby AM station on 970KHz. The DE-1103 is a bit
suceptable to images of AM stations (in the 520-1710KHz range) that
will appear in the range below 520KHz.

That's interesting. There are apparently a few low-power broadcasting stations allowed in the 151-152mHz public service/land-mobile band in Australia. See Glenn Hauser's WOR 2-182 (November 21, 2002): http://www.worldofradio.com/dxld2182.txt

Notice the India Day Web site specifies "special receiver required" for that channel.

I see a Greek-language station on that frequency in Adelaide as well.

Radio Shack used to sell a VHF Hi-Band tunable pocket receiver in the U.S. for around $20. It may be easier to find something like that than modify the 1103 to tune 40mHz higher than its design.

That is probably a digital transmission, something like the DAB system used
in the UK. It uses much higher frequencies than normal FM and requires a
special digital receiver.

They specify the same standard for LPON/HPON (low- and high-power open narrowcasting; 1 and 10w, respectively) as for the mobile services in that band, or "analogue voice angle modulated," with a bandwidth of <16mHz. I am not confident I understand their terminology correctly, but take that to mean NBFM. They are referred to as "FM" on http://www.acma.gov.au/acmainterwr/aba/broadcastserv/broadcasters/documents/on_addl_info.pdf
(although that already-out-of-date list shows only one 152mHz station).

However, info is scanty, and the desktop transmitter at the bottom of http://www.maninational.com/products/ looks like a wireless hub, and has no knobs.

Some guy is already chasing "DX" in that band, right in our friend's home of Sydney: http://www.dtvforum.info/index.php?showtopic=27568 He only says he is using a "25 preset NAS radio" so it's hard to tell just what the mode is.

I find this all a bit weird, somewhere between our LPFM and the (unauthorized but tolerated) use of 27mHz for church services in Ireland. And the Aussies get horse racing results on theirs, too.

It looks like they're putting DAB above that band, in VHF-III (174-240) and the L-band (1452-1492mhz); they're thinking of putting DRM in VHF Band I (TV 0, 1 and 2).
http://www.acma.gov.au/ACMAINTER.65690:STANDARD::pc=PC_100296

Of course by now I'm sure we have baffled 90 percent of the list.

Considering the recent nonsense, I was reluctant to make a joke post, but think I can get away with slipping one in as a P.S. here:

Why is ESPN on 69kHz?

It's their submarine broadcast.

(So-ree!)

Im Hotep,

Most likely when you tried to use the radio off the whip... you
wouldn't pick up anything but noise.
That's a good indicator that the front end has been blown away by
tens of thousands of volts of static electricity.

And not only AM/BCB stns... I get a couple of low 49m stns 900 kHz lower in the 60m band, but with very muddy audio so they're easily recognised.

The Degen isn't as bad as the Sony 7600GR for that: R. Thailand's relay via Delano on 5890 ~0200 UTC puts in a beautiful signal on 4980 on my GR.

Continuing off topic, but that frequency would be in the middle of
Aussie's TV spectrum:

http://www.tesc.com.au/Channels.htm

If a special receiver's required, it's possibly using the sub-carrier
of a TV tx.

Here in Canada, sub-c's of FM'ers are quite commonly used for
subscription services aimed at specialty language groups.

>>Well,

my De-1103 finally arrived yesterday, but apparently I was asleep when the mailperson came by. they left me a not telling me to pick it up at the post office on the 23rd.

My question is: Will I be able to hear a difference between the Degen 1103 and my Grundig YB 400 PE off their respective whips?

It shipped with a 220 AC adapter. What will I need to get it to work off of a 110 AC outlet?

Fare l'amore; non la guerra! Shrub

I would be surprised if you can hear a medium or shortwave signal on one radio and not the other. The FM in the 1103 is exceptional.

You will need a 110 volt adapter that will supply the radio's needs. Check Radio Shack for a compatible supply; don't use one of the very small switching power supplies, they generate too much radio noise.

Stay awake! :)

105-164mHz are allocated as cable channels, "Superband" S1-S10. http://www.pbn.com.au/products/technical/rf2.php They roughly correlate to our cable mid-band (98-99, 14-22).

I notice allocations S1-S2 aren't listed on the dealer chart; they're probably unused to avoid possible leakage into the aero band.

My money's still on NBFM for "VHF NAS Narrow."

That is interesting, though, about the use of SCA in Canada for minority broadcasting. Here it was all background music and occasionally Radio Reading Service (for the blind) until dereg when the SCAs began getting leased for private data transmission. RRS in my town got shifted to TV SAP, which provides a clearer signal but is less convenient for the blind.

I worked at a radio reading service in Wisconsin till about 8 years
ago. They tried to move our service to cable FM, but our listeners
stepped up. The service is still on the SCA, but also on cable FM and
now on the abdio of a community billboard cable channel.

36. Enjoying my new Degen 1103

Yahoo group: de1103

Im Hotep,

I did pick up my Degen 1103 today. So far I'm very pleased with it. It is much nicer looking in person than in the pictures, and very sturdily built.

I especially like the way it remembers past frequencies that I visited. Just by pushing a button it will go back over the last four or five frequencies.

Changing the volume is a little odd, and there are a few other quirky things about it, but I'm already used to all of that. It is no harder to use than any other SW radio.

The Kaito31 active antenna works great when pulled into the external antenna slot instead of being clipped to the whip as it was on my YB 400 PE.

I can really tell when I'm zeroed in on a frequency now. The gain really increases and you can see and hear the difference. So I would say this active antenna does a fine job when it is connected and setup up properly.

I'm going to have to go out and get a battery charger though. The adapter they sent is for 220 and I don't want to pay $35 to $40.00 to get one that will allow the Degen to work on 110/60 Hertz.

I haven't gotten around to figuring out how to store frequencies, but with 256 of them I doubt I will run short as I did with my YB 400 PE.

If I continue to enjoy this little radio as much as I have today, I may order a couple more of them just in case. you never know we may wake up one morning and discover that all electrical power is gone for years. So as long as I have a huge supply of batteries, or a good solar recharger I will be OK/

For $44.80 this Degen 1103 is definitely a must by.

And so it glows.

Flathatter,

I got antenna happy with my Degen (hot-swapping between the whip and external wire to compare the sensitivity of each) and blew out my FET the first day I owned my 1103, Dec 25! There was low humidity that day...

The result was nearly dead air on SW using the whip - the only sound was the slight "pinging" noise when I spun the tuning knob. _Very_ faint reception using the wire. FM and MW still worked perfectly.

After buying a Kaito as a replacement, I found a post by "VE6TVT" on eham.net describing the same problem, and how he fixed it. With nothing to lose, I decided to try it.

Yesterday, I recieved my FETs from an eBay seller, and today my Degen is back in service! So far, I can discern no difference in sensitivity between the Kaito and my repaired Degen.

I took snapshots as I went along in the hope that someone will find them useful. If there's any interest,I can post them in a day or two with more details ...

For now though, it's off to play with my "new" radio.

VE6TVT's eHam.com post can be found here:
http://www.eham.net/reviews/detail/5071?page=2&ehamsid=99e6dd03235e966466c8dc650c0b9fa6#40622
(If there's URL trouble, go the eham.net main page, select Reviews Categories | Receivers: General Coverage | Kaito KA1103. His comment is in the bottom third of the second page.)

Hope this helps!

Very good, thank you for the post, as it was very informative. I guess I haven't blown my FETs yet since my reception off the whip still works.

With a radio as senstive to damage as the KA1103, I will be more attentive to such matters in the future!

I'll upload the FET replacement pics tomorrow (Friday) evening. No access to my home PC until then....

As you open the case, it's located on the underside of the main board (the back part of the case, not the front part with the LCD), which must be unscrewed and flipped over to get to the FET. Labeled Q1, on the upper right quadrant of the flipped-over board. It's a black rectangular thing about the size of a sesame seed.

This will make more sense tomorrow with the accompanying pics.

41. Longwire Antenna experiment results

Yahoo group: de1103
Date: 2006-01-27 07:56:13 UTC
From: obx2001
Topic: 41 Message: 41

Hello fellow users

I am posting the results of my
longwire antenna experiments.

First I made 9:1 unun for matching
the longwire to the 75ohm coax.

The coax is two runs with a splitter
used as a secondary ground as well as
a ground of the unun.

Using two lenghts of coax hasn't resulted
in any noticable db loss in any signals.
Approximate lenght of two coax lengths is
around 80 ft.

Fist tested longwire at around 70ft
in a inverted l configuration.

The de1103 is very sensative and experienced
minor overload across the bands. Also
picking spurios am transmissions from
many local and DX am power stations.

Totally unacceptable.

Therefore shortening longwire with improvements
around 40ft length longwire.

Decided to go vertical longwire at 50ft
to tip of longwire and had to shorten
longwire to approximately 18 ft.

DX am power stations at this elevation
above ground acceptable with no spurios
emission across the bands.

Local AM power stations spurios emissions
still there but totally acceptable mixing
in with low level ground noise.

I am posting usable length of longwire at
approx. 18ft.

Excellant results across all bands including
160 meters up to 11 meters.

This is one amazing little radio that once
the antenna is dialed in can receive high
quality signals across all bands on 18ft of
vertical copper wire. Have audio outputted
to computer speakers with amazing sound.

Been running configuration for 1 week now
with no apparent overload of any internal
circuits or damage to the FET's.

Have now wrapped whip antenna with
plastic wrap to prevent any static discharge
that may harm FET's.

Hope this helps anyone thinking to make their own
outside antenna. The verticval longwire
is excellant for omni-directional
receive....

It sounds like the radio sold by Superdrug in the UK, for under ?3. These
have resulted in lots of experimentation by people on the G-QRP list.

50. Electrical noise and apartment living

Yahoo group: de1103

From: jeffkopp
Topic: 50 Message: 50

Hi. I asserted many months ago (which Jay doubted, and is probably the only one who'll remember) that my Tecusn R9702, while not as selective as the 1103, was about as sensitive. (It is a lively and fun dual-conversion pocket-size.)

Well, my assumption was based on side-by-side comparison indoors, and I never realized just how very noisy it is in here, even with the computer, LAN and TV all shut off.

Last night a squall treated us to a four-hour blackout, only in my immediate neighborhood (not the whole city), and I thought to fire up the 1103 and see just how much more I could hear while the power was out. (I have hidden about 50' of wire outside, stapled under the eaves, hoping to avoid RFI I presumed was coming from inside; it helps a tiny bit.)

Whoa, dial full from 160 meters to 13mHz at 4am. (Of course from my location all I can hear is Asia to the East Coast and South America; I presume the Radio Netherlands and Deutsche Welle I pick up come from Sackville or Delano; I know the BBC I hear here is.) First time I heard 160 meter hams in this location.

I was listening to CBC/RCI on 13mHz (a rare catch in here) when the power came back on, and it immediately dropped into the noise (audible but unintellgible), and I was back to my usual subset of QSA3+ stations, only about 15% of what I was able to hear during the dark. And this was while the LAN and DSL modem were still down, as I had disconnected them during the outage in preparation for a possible surge on restoration.

Anyway, the side-by-side during the outage showed the 9702 was about 6-9db less sensitive, and it was only the usual blanket of RFI that had made them seem eqivalent to me.

I am of course kind of stuck here, though it occurs to me my outdoor antenna might work better if I slipped it between the siding and foundation to get it away from the phone wiring and TV cable up under the eaves. Sure miss having a house and yard (or even the previous apt., which had attic access).

There is a 40-year-old pole pig directly behind our unit, feeding the underground service entrance for our building. And a stret light.

Excellent post.

It's unfortunate the radio was not better engineered to withstand static shocks in the first place. I can understand that this may not be a big concern for the Asian market, but for radio products destined for North America where static shocks are almost unavoidable during the winter heating season, some kind of protective circuitry would be a great help.

Just small things like protection against static shock or accidental reversal of polartiy for DC input, would be a great help. I have read numerous posts where someone plugged a universal adapter in with the wrong polarity just briefly and their S350 quit working for good. This is an easy error to make for older folks whose eyesight isn't as sharp as it used to be.

Attention to extra little details like this would make a good radio even better! The cost to implement these improvements would be minimal, not to mention the positive exposure Degen/Tescun would get when you guys find these added features and write about them. Some of you seem to need to take apart the radio before you even listen to it -- LOL

My old Sony 2001D doesn't have any static protection, either. Later models did have it fitted (a couple of diodes). I keep meaning to modify mine.

Leon

What can we buy to place near our computers, or radios to ground
ourselves before we touch them?

I think the fact that the radio was on while I was fiddling with the antennas had a lot to do with it.

Since my static mishap, I've trained myself to turn the radio off before plugging/unplugging any external antennas or speakers, or adjusting the whip after walking around the room.

This might be overkill, but it makes me feel better.

Great info though I don't need it.

One suggestion for those who bought
100 fets for $8 on ebay might be
to offer some for sale. It just seems
a shame that 99 of them would gather
dust when a person only needs one.

Electrostatic discharge precaustions for the production line workers
are still a major concern during components assembling during
manufacturing. As a logical thinking believe even if you turn off
the radio, the FETs can still be "killed" by the electrostatic
discharges. True?

Well,

After playing around with the radio for over a week, I finally got the courage to tackle storing frequencies. After I stored two, I became very confused.
What is the best way to utilize 256 frequencies.

What if I want to store the six strongest frequencies I get at each hour of the day Zulu time?

How would I do that in a way that makes sense?

very true...I worked as an electronics tech about twenty years ago and
static sensitive devices are just as vulnerable when not powered.

Believe the following trick may work.(unfortunately I never try this !) For example: stations at zulu 0100 can be stored as 11, 12, 13 ... in the memory. and stations at zulu 2300 should be 231, 232 .... etc. Please let us know if such trick will work.

Im Hotep,

I sent this last post early this morning when I was very sleepy.
Perhaps I didn't make myself clear.

What I would like to do with my Degen 1103 is set up the storage so
that all of the channels I pick up clearly each hour are stored in
such a manner that the frequencies for "2100 to 220" are easy to find
and the clear frequencies for 1800 to 1900 are stored together so
they can be quickly accessed.

I have heard someplace that that can be done, but the Degen
instruction manual wasn't clear at all on how to go about doing that.

If anyone here has a good solution to this, please share it. I'm sure
there are others wondering about this same thing. :-)

Peace.

Thanks for mentioning the balun again. Those who were following the old list may recall my poor results with 40' of wire stapled under the eaves (I am stuck in an apartment) versus the high level of electrical noise here. I had connected the wire where it came in through the window to shielded audio cable, the other side to house ground (which made me a bit nervous; the place is 40 years old, so I don't trust its ground completely).

Last week I felt a bit more motivated, and got out my junk-box of TV stuff to retrieve a balun and a length of TV coax. I connected one side of the balun to my wire and the other side to what I think is a quieter (and perhaps safer) ground, the cable TV sheath (they drive their own ground stakes so it's separate from power distribution).

This did give me some improvement, though I have no clue what the impedance of my longwire is.

While in my junk box I ran across an old Radio Shack 10db inline amp (one of those barrel things with a separate power supply, the amp designed to go up by the antenna) and to my surprise found it marked as "5-900mHz." I wondered if they had meant 50-900m but their docs confirm it's rated 8db gain at 5. http://support.radioshack.com/support_video/65893.htm And it does give noticeable gain even down on 60m.

Of course amplifying a poor/noisy antenna just yields amplified noise, but my next step is to move the balun and amplifier as close to the entrance point as I can, to hopefully overcome some of the indoor RFI, though during a recent power outage I discovered as much of it comes from the vicinity outside as from in here.

Looking for schematics of baluns (curious about connecting a couple TV baluns together to change the impedance facing the antenna), I ran across this "basics" tutorial Web site by a retired ham in Australia, which is just the right speed for someone like me who doesn't really know much electrical theory. Nicely done: http://www.electronics-tutorials.com/site-tree.htm

Regards,

Jeff

I will post a file in documents regarding
the 9:1 balun. It is made with type 43
ferrite and about 1 1/4'' wide and looks
like a doughnut.

I had difficulty locating a ferrite
core for a reasonable price. I did not
use a tv balun which is 300 ohm to 75 ohm.

I had poor results with much overload using
lengths longer than 20 ft for the random
wire, however I have excellant results using
18 ft lenght wire at 50 ft elevation.

Ok. Merci beaucoup monsieur Knyuen,

I will look at the manual from the files section again, or maybe for
the first time since I received one with the radio.

I have pretty much decided that from the hours of 0100 to 1000, I
will do as someone suggested.

If I have eight frequencies that come in good at 0100, I will store
them as 11, 12, 13, 14, 15, 16, 17, 18.

If at 0900 Zulu I have four stations that come in clearly, I will
store them as 91,92,93,94.

These are the times when it is night time and early morning for me
here in the midwest. So it is when I receive the majority of stations anyway.

I'm not sure yet what I will do with the stations I receive from 1000
to 2400 Zulu. The Degen doesn't go beyond 99. It then gets into a lot
of alphabetical characters. I haven't figured out what to do with
those yet. Hopefully reading the manual will aiuto mi.

C'est la vita! :-)

I At 05:22 PM 02/01/2006, you wrote:

I suspected that pic was "photoshopped," but didn't want to post that
hoo-hah while the group was being heckled. (I also resisted the urge
to scan my 1103 and "run it up to 5gHz"; I must be getting old.)

However, while reviewing my old 1103 files to see if I had anything
worth re-uploading here, I ran across the "unlock >30mHz" trick.

I had tried it at the time and gave up, believing my unit was not
capable of this hack. However I gave it another try, and found I had
overlooked his advice to be _very quick_ to catch it between its
rolling over 30 before flopping into the FM band. On about the third
hair-trigger attempt, I managed to snag it at 30005kHz and promptly
set a memory for it.

However the usefulness of the 1103 is very limited up there. Whatever
random noise I do manage to hear drops off the shelf around 35mHz,
where I presume it hits the top of the lowpass filter.

Curiously, it will roll over to 0kHz after 39999 (displayed as a9999),
displaying the actual frequency + 10kHz (e.g., 1000kHz is shown as 11000).

Regards,

Jeff

I wanted to thank you for taking the time to post the details. I am sufficiently encouraged by the modest improvement a TV balun gave me that when I have time to tinker, I'll give winding a proper balun a try.

Regards,

Jeff

They're hexadecimal notation, used to display the 256 memory positions in two character positions. AF = 175, for example. And between the apparently adjacent 19 and 20 are six more memory slots, 1A through 1F.

There is a table of the memory "banks" on page 5 of the user-contributed short manual in the files area, Guide-DE1103.pdf. Or you can use Windows' calculator (on the Accessories tab) to do conversions from hex to decimal.

If you used the A's for 10h UTC through the F's for 15h, that'll get you close to bedtime for the Central Time zone (hi).

(Irrelevant digression: I used duodecimal back in the DOS days to date files within the 3-char extension as Mo/Day, using A for Oct, B Nov, and C for December.)

Regards,

Jeff

Its easy really. The hard part
is finding the proper ferrite core.

The results are great.

Topic: 71 Message: 72

Hello,

I know I received the Halifax WEFAX on my PC through my Degen. While a little scratchy (still working out my antenna kinks!), it looked nice. I finally got it working by tuning in a strong signal, going to SSB mose, and tuning out the noise with the fine tuner to where I could hear the broadcasts clearly on SSB. Then I tuned back to the WEFAX station. Worked wonders. What program are you using to receive the fax, or are you using something else?

Nick

http://www.nickqueen.com

Adam Yuret wrote:
I have an 1103 and I bought it primarily for the SSB feature. I am trying to use it to receieve weatherfax for use on an Offshore sailboat. I want to iron out the kinks in the system before relying on it as my primary source of weather information in the Pacific. Currently I get nothing on ssb whatsoever. I have been using it in my house which is not made of concrete and when I tune the Pt Reyes frequency I get a different kind of noise (A squeeee type noise instead of a white noise hiss) but I know the noise is not the fax transmission. sometimes I will hear faint beeps under the squee and as I tune it the fax image doesnt improve.

I wondered if mine is busted or if I need to be on a hill or outside or go to sea before I can recieve Volmet or weatherfax on ssb.

I have never been a radio geek but im trying to ramp up ;-)

Thanks in advance,

Adam Yuret

Hi Leon,

Well, at least you have the ability to delete someone
who acts like an *&$%^!

By the way, did all of the info (files, photos, Web
sights, etc.) get transferred to this new group? I
would like to delete my name from the old group If
everything has been copied over.

I also am thinking of modifying my Degen DE1103 to
copy DRM programs. Mine has the jumper were you can
tap off for the 450 khz sig. I have a down converter
and the program for the computer. Has anyone else
tried it?

Thanks for taking the time to start this group, Leon. I was really fed up with off-topic rantings of one particular person that we all know. I am new to this forum today, and look forward to a peaceful, productive and informative group! I've owned my DE1103 for almost a year, and love it. I've owned shortwave radios for over 30 years, and fall in to cycles of dedicated listening and not listening. I look forward to getting to know the group members in the future.

I suppose I should wait until I actually take delivery on KA1108, but I can't wait to ask about the quality, or lack thereof, of the automatic volume (gain) control circuitry in the KA1108. With the volume being so slow to adjust, it would be difficult to scan around with the older type radios I'm used to using, if the volume control was as hard to use as with the KA1108. Has anybody noted this as a short coming? Thanks!

Lido, sorry if I offended you. I'm certain you are more than welcome
by everyone here.

Like my original post said, I was just being paranoid and I was
laughing at myself. Please take what I wrote with a grain of salt.

The gremlin who plagued the last user group left many very skeptical
and suspicious. His writing style, if you could call it that, was
peppered with deliberately miss spelled words and off the wall,
increasingly vulgar, gibberish. His wraith was the catalyst that
caused the exodus to this new group.

Lido, sorry if I offended you. I'm certain you are more than welcome by everyone here.

Like my original post said, I was just being paranoid and I was laughing at myself. Please take what I wrote with a grain of salt.

The gremlin who plagued the last user group left many very skeptical and suspicious. His writing style, if you could call it that, was peppered with deliberately miss spelled words and off the wall, increasingly vulgar, gibberish. His wraith was the catalyst that caused the exodus to this new group.

From: knyuen88
Topic: 91 Message: 91

Even I do not own a DE1107 yet judging for the picture of this radio
believe it uses an independent battery to power the LCD displays
(just like most camcorders)rather than by the radio's AA size
batteries as the DE1103 does. Please check the user manual if it
mentions anything about replacing the "clock/display (or whatever
name)" batteries. At worse may need to open the case and look for a
button type battery mounted somewhere in the PC boards. Replace it
and will likely solve the problem.
Hope this helps.

Subject: [de1103] DE1107 no time display (cross post)

I've had my DE1107 since last October, and I use it at work all the time. Just today the LCD time display no longer works. The radio still plays but the time display doesn't appear.

I tried removing the batteries for a while and installing them again in an effort to "reset" the radio and I also tried using an AC adapter. Both methods made no difference.

The radio has been treated with kid gloves and has never been bumped or dropped. The time display never appeared weak before it died out completely either. Up until now the radio has been running strictly on batteries.

Does anyone have a suggestion before I return it for warranty repair?

I checked more DE1107 info at home and seemingly no independent battery required to power the LCD displays alone. Please dont waste time to trace such "none-exist" battery. I am sorry to give you the incorrect info. Anyhow, think positive, it may not be a complicated electronics problem. Likely caused by a dead light emitting diode(s) next to the LCD window. If this is the case try changing your viewing points at different angles (under reflections) and confirm if the clock is still working. I fixed my car radio's "dead display" once by replacing a burn out illumination light at the back of the LCD screen without applying "intensitive" trouble shootings!

I've had my De1103 since December '05 and I have not had that problem.
I live in AZ and the humidity right now is around 3-5% so there is a
lot of static electricity. I just take care to ground myself usually
by just holding my hand to wall for a few seconds. This is my first sw
radio and I love it.

98. BCB filter

Yahoo group: de1103
Date: 2006-02-10 11:01:35 UTC
From: jeffkopp
Topic: 98 Message: 98

A while back I inquired about a high-pass filter when we were discussing the problems we who live near local stations face. Someone thoughtfully referred me to some plans, but unfortunately constructing such things is no longer easy for me.

I did find a reasonably priced filter (~$30) listed at http://www.iceradioproducts.com/filtersrf.html#bcb after seeing it mentioned on Radio Netherlands' site.

The lightweight ("receive only") models are fitted with RCA jacks, which should make them easier to deal with (as adapters are readily available).

I did remove the 10db 5-500mHz coax barrel amp I'd placed at my 75-300 balun, as it raised the background noise considerably, though after removal I realized it only made tuning around noisier, but it was not bringing in more interference. And it did sort of reduce images from <3mHz, though I am not sure if it was acting as a filter or merely elevating the signals above that point higher than the BCB signals.

Ten-Tec sells a simple enclosure for connecting lead-in to a dipole, but it's merely a convenient enclosure, no balun. But only $10. http://radio.tentec.com/Amateur/Accessories/TT3003 Link to the manual .pdf doesn't work but can be found at http://www.aoruk.com/tentec/aerials/model3003.pdf

As for the anxiety I see here about statis and the RF FET, I have only seen it reported rarely here (there were also a few who received units with "only a quiet hissing sound on all bands"), so I suspect this is a probably sporadic mfr defect, and not a delicate problem to be especially concerned about.

As for that photo of an ad fpr an eaves antenna by Radio Shack for $29, I think someone was pulling our leg a little. After hunting futilely an hour for the thing, I realized that magazine must have been twenty years old.

I don't think it's a problem with this particular radio over any other one. Static electricity is a proplem with many peices of electronic equipment.

I've had my 1103 since summer 04 with no problems.

I've probably learned the hard way about static electricity. Back in the mid 80s I blew out the AM section of a portable radio/recorder by touching the FM antenna. I've been careful ever since.

Doesn't the humidity have to be below a certain percentage before
this type of lightning strike can occur?

If so , what is the humidity level below which things become so dry
that you shock the himmel out of yourself every time you touch things?

This message crossposted to unmoderated 1103 group also.

Hi

After a year of use I managed to break the backstand on my Degen 1103. I did a search of past postings but felt that the info may or may not be current. So I thought I would post a query for the latest known info on sourcing for the 1103 backstand.

If you have recent info on where/how I can obtain one I would appreciate it. Contact phone numbers and/or web and/or email addresses would be appreciated.

Thanks in advance.....Mark/W8VNZ

I just downloaded the two files and they unzipped OK, using WinZIP.

Also, are there any changes in this
> 'manual' from the one/ones that have been posted in the past other

Should be the same. It's the 15 page 'official' Degen one.

hey there,
I am a new member and a Degen Newbie. Well, not even, I am awaiting delivery of my DE1103 from China.
I also have a Sangean 909, and assorted old RAdio Shack/realistic knock-offs.
The Sangean is ok, but I was a little underwhelmed with its performance off the whip. I added the degen amplified antenna and it got a little better. I am now considering an outdoor or an attic antenna. If anyone wants to offer some advice, fire away.
One more thing, any news on WHEN the De1108 will arrive and how much it's gonna cost? I'd better put a few nickels away now.

I had the same problem. So I boxed up the radio and shipped it back
to them and told them to give me the first Degen 1108 that is produced.

I expect to hear something positive soon.

Hi Mark,

If you are in the US, try calling Kaito USA at 1-866 KAITO76 and see if they have a parts department. If so, maybe they will have a replacement.

Let us know,

Rick W4DST

Hi, for the esternal antenna in the box of the Degen there is a long (short) wire that run quite well. You can also use a long (not less than 20 meters or abt 200 ft) with a capacitor (varable) in series near the receiver. In the Degen the is a jack for external antenna.
Remember, the wire would have to be highest and far from electric lines, battery charger, computer and so on. You have to try for best results becouse sometimes (often) big signals are not the same then good reception.

Subject: [de1103] newbster here

hey there,
I am a new member and a Degen Newbie. Well, not even, I am awaiting delivery of my DE1103 from China.
I also have a Sangean 909, and assorted old RAdio Shack/realistic knock-offs.
The Sangean is ok, but I was a little underwhelmed with its performance off the whip. I added the degen amplified antenna and it got a little better. I am now considering an outdoor or an attic antenna. If anyone wants to offer some advice, fire away.
One more thing, any news on WHEN the De1108 will arrive and how much it's gonna cost? I'd better put a few nickels away now.

A long antenna is definately better than a short one for picking up
weak stations. "BUT" also need to consider the shortcomings.
1. It will pick up atmosphere noises/interference and static
charges from the atmosphere and may blower out the radio front end
FET transistors. (see other discussions in this forum)
2. It will overload the radio by "strong" signals(including those
local MW stations) and made receptions difficult/impossible.
Nevertheless most stations nowadays are petty strong and broadcast in
different freq.at the same time. Selecting the "right" reception
frequencies and lisening hours is more important than using a "long"
antenna to boost the receptions.
Hope it helps.

114. Comparison with an old communications receiver

Yahoo group: de1103
Date: 2006-02-18 19:10:01 UTC
From: leon_heller
Topic: 114 Message: 114

A friend of mine collects and restores old miltary radio equipment made by companies like Racal and Redifon. His favourite receiver is a Redifon R551N, which is connected to a long wire antenna via a motorised ATU. The R551N was a very high specification receiver and must have cost a great deal of money when it was in production.

When I went to see him yesterday I took my DE1103 with me, and we tuned both radios to the same stations on the 14 m band. The DE1103 was just using the whip antenna and we found that although it wasn't as sensitive as the R551N, there wasn't all that much in it. Of course, the R551N would be much better when bands are crowded, due to the much higher selectivity available.

Got the radio and have already had an interesting issue with signal
overload.
When I first started listening to the DE1103, I thought that there
was a problem cleaning up the SSB signals with the "fine tune" knob.
I couldn't seem to zero in on a signal and clean it up, the way I
could with the ATS-909. As I got more familiar with the degen, I
realized that the problem wasn't a lack of clarity, it was that I
was picking up SOOO many more signals on a frequency. Instead of
hearing one signal, I was hearing 5-10, I guess. When I finally
figured out how to operate it, I could pull a signal from hundreds
of miles farther than I ever could on the 909.
Amazing little radio.

Good lucky with your quest for a back stand.

121. Clock Speed

Yahoo group: de1103
Date: 2006-02-26 15:53:22 UTC
From: katie10543
Topic: 121 Message: 121

I really like this radio, but the clock in mine runs fast. It's gaining about 10 seconds/day, which is just horrible for any xtal controlled clock. Do I have a bad unit or is this a common problem? If the latter is the case, does anyone have a fix for it?

The xtal is just barely accessible under the metal shield in the top half of the unit. When I measure the frequency (with an accurate counter) it reads 32768Hz +/- .05Hz. So the xtal itself seems to be good, but there are a few possibilities that I can think of:

1) The clock circuit is picking up noise and generating extra clock ticks.

2) Just measuring the oscillator frequency is putting enough load on the circuit to force it to oscillate more accurately. (If this is the case I need to figure out an appropriate load to permanently add to the circuit.)

3) The firmware in the CPU is buggy (but then everyone would have this same fast clock problem).

Thanks,

-K

Found the following in the internet:--- I never try it though.
"... connect a 120P cap in parallel with the C802(see the CPU
schematic)... " No doubt this is an approximate value and an
adjuctable cap substitude should be more desirable. Needless to say
in order to meet you demanding criteria the quality of component(s)as
well as the accuracy of measuring equipments used will be VERY
critical.
Let us know if such modification helps.

That makes sense and agrees with my clock frequency measurements when I hooked up a counter to that point in the circuit. I'll make the modification and report back on the results after a few days of testing. Thanks!

FYI, this turns out to be a really hard problem to solve in general, finding the source of a problem 32768Hz oscillator. Take a look at this paper:
http://www.eetasia.com/ARTICLES/2004DEC/A/2004DEC14_NTEK_AN.PDF

I've not checked mine to the second, but it's gained about 2 minutes in the same number of weeks. It is a minor annoyance compared to the great performance of the radio, though. Its just the opposite of Sony clock, that lose time.

127. KA1103 for sale; new/mint

Yahoo group: de1103
Date: 2006-02-28 05:14:30 UTC
From: Tom
Topic: 127 Message: 127

Howdy.

I ordered an 1103, hooked it up, and listened a bit, and now it's been sitting on my bedstand for a month unused.

I thought I'd see if anyone in the group here is interested before I go to Ebay.

It's the (US version with 1 year warranty) ka1103 with the KA31 active loop antenna.

Not a scratch on it...all accessories included (recharged the batteries once when new--that's it). Original packaging, inserts, etc.

Here's a pic:

http://www.stanford.edu/~twiggins/sale/1103.jpg

I paid $120 + $15 shipping.

I'd like $100 for it--and I'll cover shipping + insurance to you.

I'd prefer Paypal. I'd have to wait for a check to clear.

Please email me at twiggins(at)stanford(dot)edu if you are interested.

Please don't haggle or lowball me. If it isn't gone in a week, I'll put it on Ebay.

Thanks,

Tom

Radios4you charges $120 + $10 for the U.S. Kaito KA1103 + KA31 active antenna:
http://www.radios4you.com/kaito-ka1103.html

So he is offering a discount off of their price.

There are some people who have enough money & want to buy in the U.S., while many of us enjoy the great discounts we get on EBay, when we order directly from China.

130. Best Battery Chargers

Yahoo group: de1103
Date: 2006-03-01 23:42:38 UTC
From: Clyde Benson
Topic: 130 Message: 130

Top of the day to you mates,

Does anyone here have any experience with these
two chargers? Do you know anyone who is using
them? Do you think they are worth the money?

Any other thoughts are welcome.

The NEW ACCUMANAGER 20 - Special $48.97 - battery
charger is designed to charge any combination of
AA, AAA, C, D, & 9V NiMH, NiCD rechargeable
batteries and the new AccuCell RAM☐ battery sizes at any time

http://www.thomas-distributing.com/ap-accupower20.htm

Or this one:

ANSMANN Deluxe "Energy 8" Battery Charger Your Cost $85.97

The Ansmann Deluxe Precision "Energy 8" battery
charger is one of the most advanced battery
chargers on the market today, and the answer for
charging up to six "AA" or six "AAA" rechargeable
batteries and two 9V rechargeable batteries all at the same time

http://www.thomas-distributing.com/ansmann_battery_charger_5407022.htm

131. Reception report

Yahoo group: de1103

Topic: 131 Message: 131

ImHotep Amigi miei,

Well,

I got my first Sony 2010, SN 91400, that I bought on Ebay for $265.00 last December out of the repair shop today. it stopped working about a week after I received it. I was plenty mad about that.

Anyway Joe, my local small town electronics repair guy, took five weeks to repair it, but he only charged me $33.00. He said the reason it suddenly went dead was that something in the battery compartment was not making a good connection. So he wired a jumper to take care of that. He also installed several other things. He said the FET transistor was OK, and he didn't need to replace it.

So I got it home expecting the worst. I turned the radio on at 1830 Zulu. I tuned into 21470 VOA. The station was hearable, but none of the lights lit up. I carefully tuned the Kaito 31 until I was able to get one 1red dot on the 2010 to light up.

Then I took it into the bedroom and hooked it up to the long wire running from my bedroom to the back porch. I guess it is about 50 or sixty feet in length.

To my amazement, 8 red dots lit up. The station came in loud and clear. I was astounded at the difference. The random wire blew the Kaito 31 away on the Sony 2010.

Then I hooked the wire up to the antenna of the Sony. The dots dropped back to about 3 It was still listenable, and stronger than the Kaito, but much weaker than when plugged into the AM antenna jack.

So since the Degen 1103 works very well on the Kaito31, I will continue using it in the living room and leave the Sony 2010 hooked up to the long wire that I was using for the Grundig Yachtboy 400 PE.

I will put the Grundig in the bathroom so that I will have something to listen to when I'm bathing. Since I only do that once a decade, the radio will probably rust sitting there. :-)

I'm one happy camper today. Now if I can only get the second Sony 2010 working. It looks to me more of a challenge than the first one.

Anyway, I thought some here might find my tests interesting.

I've done some research on the AccuManager 10, a small brother of AccuManager 20. AccuManager 10 can handle only AA/AAA batteries, but they share the same technology (chip). Manufacturer's web site is here: http://www.accupower.de/ . All reviews I found were very good, but all were on different German-speaking forums (mostly photo). AccuManager 10 is on the top of my list along with Maha MH-C401FS.

Here is another link which might be helpfull:

http://www.crypto.com/chargers/

Well,

I charged up 4 old Ni-Cads that were over a year
old and not in use plus 4 new Degen NIMH's with this new Arnsmann Energy 8.

It only takes about an hour to an hour and a half
to fullly charge the batteries. It is really
awesome. My old charger took eight hours or more to charge 4 "AA's"

This is like stepping out of a Volkswagon Beatle into A Mercedes Benz! :-)

Speed is not always a good thing. Quick charge = high charging current, which usually means high temperature of cells and could shorten life of cells. Optimal charging current is a constant topic of debates.

Must have charger for AA or AAA:

I love the LaCrosse BC-900. You can set the charging current, and it has independent chargers for each battery and a display for each.
It's the nicest I've ever seen & IMHO, a must have.

Two good sites for info: Thomas Distributing & Amazon.com (nice user reviews on Amazon)
You can get data sheets or manuals on both sites:

http://www.thomasdistributing.com/la_crosse_bc-900_battery_charger.php
http://www.amazon.com/exec/obidos/tg/detail/-/B00077AA5Q?v=glance

Best,
Jay

I don't know all the receiver you mentioned but I checked my 1103 with my ic 706 and the difference is little on MW and increase on highest frequencies. It has some problems but for 70 buks you can't have more. I like the 1103 and for me is a good receiver.

141. Re: Clock Speed - followup

Yahoo group: de1103
Date: 2006-03-04 02:11:53 UTC
From: katie10543
Topic: 121 Message: 141

Here's a followup report on the clock speed fix that I tried....

I installed a 100pf ceramic disc capacitor between one pin (the one that goes the the XOUT of the CPU) on the 32768Hz crystal and ground. Because this leg of of the crystal is right at the end of the metal shield in the top half of the case, it was pretty easy to access. In fact, I was able to install the capacitor without even separating the case halfs by disconnecting the ribbon cable and encoder wheel plug.

After about 4 days of testing I found that the clock is now only gaining about 1 second/day! A great improvement from the 10 seconds/day that seems to apparently be a common problem with this radio. I suppose that a slightly larger value capacitor might even be better, but 30 seconds/month is about all you can expect from a non-ovenized, low frequency crystal anyway.

About a month ago, I replaced my older RadioShack/Sangeans with an ATS-909. I researched every portable out there and decided that
1. the 7600GS was probably best, but
2. The 909 was pretty close and had a LOT more features.
Then I saw the hype over the DE1103, and really just didn't believe it. A cheap little Chinese transistor could NOT be as good as the Sangean or the Sony.
After a month with the 909, I was underwhelmed, to say the least. I bought a DE1103 with the intent of testing them side by side. I could tell the second I fired up the Degen that it blew the 909 away. I did some random testing just to quantify it, but it really wasn't necessary.
I sold the 909 the other day and got my 175 bucks back. I have a total of $68 in the Degen.
So now I am waiting for the 1108...
Buy the De1103.

Thanks for your reply. Im going to go ahead and buy one. One of the things I liked when I first saw it, was the the analog look to the face. I thought it looked excellent, and will make a nice addition to my collection. The input I have received here has been great. I would like to thank you folks. There's nothing like talking to a bunch of SWL's in a civil atmosphere. Dx-ing International HF radio if a great hobby. I have been doing if for over 40 years and have never been tired of it, it always seems to get better.

I bought mine primarily for use on camping trips on the motorbike. I usually
take my VHF/UHF HT which can receive FM and AM stations but it really needs
an external antenna for decent reception.

The Sony 2010 is a better radio for use with antennas and accessaries. It can handle bigger signals without overloading. Buthe the Degen/Kaito 1103 is a better "out of the box" radio. You get great performance the moment you fire it up. The 1103 is more suseptable to overload with big external antennas.

We all love the 1103 it is fantastic but I wanted to tell you about another shortwave the Kchibo KK-216. It was bought on Ebay for twenty dollars. First you can look at their website on the net the factory and number of workers was food for thought. The radio covers AM FM and all 20 bands. It is very well made and runs on two d cells. I have tested against the yb 300 and it recieves weak stations better then the yb 300 and it has a 3 inch speaker that really sounds good.Look I thought 20 bucks for twenty bands it was worth the gamble.The radio gets a A for fun, reception and sound.The 1103 is the king but this one belongs in the court.

I do like a 2010, but the used ones on E-Bay are going for about 350 bucks and I wouldn't pay that much for one of them. When I want to tune up a big receiver I turn to my old Drake or Kenwood and then I dont worry about any kind of overload or anticipate any problems like that. I also use a DX-396 with some filter modifications that does a fine job on all bands. Portables are portables and they are subject to overload with larger antenna, but, if you do utilize a larger antenna at home, I use an MFJ-959B Tuner/Preamp in the line and then I can manipulate the signal to surpress overload, but still beat the signal off the whip if Dx conditions are bad around here, especially in the summer. I'm just a radio nut, and I can't help it. I've been Dxing since my father first showed me how to tune a Hallicrater SX-100 when I was a kid, and I'm 58 now so I guess I'll never change. Have great week. (I know I will when the new 1103 arrives).

From: dxgnome
Topic: 152 Message: 152

Hello,

I want to ask some other members here with an issue I'm having with a new Kaito KA1103 I purchased recently. I basically like the radio, but the audio quality, especially on the AM MW band, is thin and distorted. Setting the DX/Loc to Loc doesn't help on strong signals. The audio quality of the FM and other SW bands is satisfactory, but I spend a lot of listening time on AM MW, so this is a bigger issue for me, and a few reviews mention this problem as well. This radio replaces a KA1102 which met an unfortunate accident, but I think the 1102 had/has much better audio clarity than the 1103.

OK, so I have read about the resistor upgrade (changing R223 and R224 on a voltage divider from 2K to 1K ohms) as well as the Audio Mod from Kiwa.com.

Questions:

How many others here are aware of this problem?

Does anyone know if this effects all the manufactured DE1103/KA1102s, or just an handful?

After researching the resistor value issue, it appears on the schematic that the resistors should be 1K and not 2K, so why these were used during manufacture one can only speculate. I'm going to contact Kaito support about this issue and see what they say. Again, I like the radio, and I think it's a great value. But the value is disminished if the audio quality isn't enjoyable. I can certainly do the mod, but I'm wondering if it is worth it.

Any comments?

My first 1103 was the same way. The audio was distorted. I sent it back to KAITO USA in California and they replaced it. The new one is much better and I'm now satisfied.

Hi, I read about your problem tha the solution was to change two resistors that in factory installed of the wrong value. If I remember they were on BF amplifier. The correct value was 1 kohm but the factory instead installed 2 kohm.

156. KA/DE 1103 Audio Distortion Problem...

Yahoo group: de1103
Date: 2006-03-08 19:42:08 UTC
From: dxgnome
Topic: 156 Message: 156

I contacted Kelly at Kaito USA, explained the issue, and he agreed to send me a new 1103 when they receive my current radio. He was unaware of the resister value issue, so I sent him an email with all links related links and file attachments to bring it to their attention. Also mentioned the ESD problem with the antenna and the mods offered by Kiwa.com http://www.kiwa.com/KA1103.html Hopefully they'll send the info along to the reps at manufacturing facilities and make future changes - maybe not, but it's worth a try. This is too good a product not to have these issues dealt with.

So, we'll see if the new radio, when it arrives, is any better. I would have no problem do the resister mod myself, but being it is so new, I would not want to void the warranty if another issue comes up.

Thanks for the replys. I let you know how it turns out.

for sure.

But what about the fact that new batteries may sit on the shelf
or hang from the pegboard for a year or more before they are
touched and charged after you buy them? Those are not recharged
every 60 days -- are they "bad" when you get them initially? (Don't
they have to be charged to be tested when they are built and
initially packaged for sale?)

And what about radios, especially emergency crank-up models,
with built-in NiMH batteries? They may be charged once when the
manufacturer builds and tests the radio, and then sit in their
boxes for months or more until they're sold and begin to be used.
Are these "bad" from the start? And even after these are bought
and used a couple times, they then might sit untouched until the
next disaster or power outage, when the owner takes them down
and cranks them up. Are these built-in batteries "bad" by then?

If this is true, it means that the original BayGen FreePlay
design, with no built-in NiMH batteries and running entirely
on the spring-wound generator, was far better than the later
and current models in which the spring-wound generator charges
NiMH batteries, which then in turn power the radio/light/whatever.

Comments?

Will

Hey there!

You have posed some excellent questions. I too am waiting for some
learned folk to answer them. :-)
Where is Joe An.....? He has the answers to everything having to
do with shortwave.

I'm thinking of buying a big 100 watt solar panel, or two soon. That
way when the power grid is blown out of existence, I will be able to
charge my batteries using electricity generated by solar energy, and
listen to whatever stations are still on the air.

I've had my DE-1103 for 18 months now. I've also had the MW problem. Being visually impaired, I'm not even thinking about the mods, so I've just lived with it. The 1103 has much better MW (& all other bands) sensitity than radios costing much more, so I'll take that trade-off.

I agree. After doing some more research on the web, I found several posts of users who have return their radio's for replacements only to have the same problem. So for the time being, I'm holding on to this one for awhile and have decided not to return it to Kaito USA for replacement. Will use it for a couple of weeks - I'm learning to live with it. I just miss the better audio quality from the KA1102.

But your right, it does have better sensitivity and does a better job picking up the SW bands over the 1102 (which is a good performer in it's own right) - definitely a keeper for what it can do.

Mine (bought from Hong Kong supplier) sounds fine.

As an after though if it occured only in the AM broadcast band (not the FM or other shortwave bands), can it be due to front end "overloading" ? -- Please remember the sensitivity of DE1103 is much better than most other radios. Why not try to pick up a distant/weak station or pickup the same station from different location(s) in the town and confirm if such problem(s) disappeared. Please let all of us know if this is the case.

Subject: [de1103] Re: New Guy Here

About a month ago, I replaced my older RadioShack/Sangeans with an ATS-
909. I researched every portable out there and decided that
1. the 7600GS was probably best, but
2. The 909 was pretty close and had a LOT more features.
Then I saw the hype over the DE1103, and really just didn't believe
it. A cheap little Chinese transistor could NOT be as good as the
Sangean or the Sony.
After a month with the 909, I was underwhelmed, to say the least. I
bought a DE1103 with the intent of testing them side by side. I could
tell the second I fired up the Degen that it blew the 909 away. I did
some random testing just to quantify it, but it really wasn't
necessary.
I sold the 909 the other day and got my 175 bucks back. I have a total
of $68 in the Degen.
So now I am waiting for the 1108...
Buy the De1103.

167. DE31 antenna question

Yahoo group: de1103
Date: 2006-03-10 22:59:31 UTC
From: ndhr23a
Topic: 167 Message: 167

I recently bought a DE1103 and am quite pleased with it's reception with the built-in whip antenna and the short-long wire antenna supplied. However, I can't seem to get much reception with the DE31 active antenna I bought with the DE1103. Ive tried the DE31 hung from my ceiling, in the attic, and ~12ft up a tree but the results are about the same. For reference I'm comparing signal strengths of the 10MHz WWV station where I get nearly full signal strength with the whip antenna but only about 1/3rd that with the DE31 and there is little difference noted using the adjusting knob on the DE31. There is a difference if the DE31 is turned on or off so I know it is doing something. Is this normal??

Also, the wire antenna supplied with the DE1103 has a 2 conductor phono plug but the DE31 has a 3 conductor stereo plug. Could this be part of the problem?

Maybe its just me being to picky. I forgot to ask in my earlier post
if anyone has been able compare their 1103 to the 1102 in regards to
the audio quality?

Hi Leon,

Yeah, mine basically sounds find too except for the AM. Others have said too that their's sound fine also. So, it appears to be just a batch of the radio's that exhibit the problem.

Question - have you done any of the mods to yours? Have you checked the resistor values of R223 and R224? I'd be interested in those of you who say your radios sound fine what those resistors are (Obviously don't go opening your radio's just to find out if you haven't already)

Paul

Just rotating the radio so that the ferrite rod picks up less signal should
have the same effect. I can't see it being due to overloading, though.

I was not aware of this problem, but I do not have a problem with any distortion on audio. Maybe it has to do with an install of incorrect resistors in a small batch of early radios.
I bought my Degen 1103 on ebay brand new and it came with a little slip of paper that has: DE1103, 05, 09, 15, (3) printed in blue. I assume this is the model number, date of maufacture (Sep. 15, 2005?) and revision number, but I do not read chinese so I don't know what they exactly mean. It seems that the batch that my radio comes from does not have any noticible problems, in fact I don't think there are any problems with it, although I have only had mine for less than a year.
I consider the de1103 a great buy for a small amount of money. Now waiting for the 1108.

Since both you and I never encountered any AM distortion problem, little I can duplicate such overloading problems and try your suggestion. Nevertheless hope others can verify your suggestion. More importantly we need to verify if the problem(s) is due to overloading in the first place otherwise any audio circuit modification will never resolve such defectiveness.

173. KA31 Loop Sony 2010, and Degen1103

Yahoo group: de1103
Date: 2006-03-11 22:43:43 UTC
From: Clyde Benson
Topic: 173 Message: 173

At 2145 Zulu I was listening to 11675 BBC on my Sony 2010

I have the KA31 plugged into it. The lights are pegged all the way to the top and holding steady. So I unplugged the KA31 and extended the whip antenna all the way up. Then I turned the radio back on to the same frequency.
To my amazement, I was getting from 0 to 4 red lights, and it was going up and down rapidly.

Nothing I did would improve that. I changed the direction of the radio, tuned slightly off freq either way.

Then I turned it off and hooked the KA31 back up. I have the loop hanging from a hook on my front porch outdoors.

The signals immediately went all the way back up to the maximum. The station came in crystal clear without any noise at all.

I then tuned my Degen 1103 to the frequency using the whip antenna. It max'ed out and was clear as a bell. I hooked up the KA31 to the Degen and it was still max'ed out. I couldn't hear any difference. Also the Degen 1103 is much more sensitive than the Sony 2010 off their respective whips.

Today is an in and out of the clouds, very warm rainy day 23 degrees Celsius day in Southeast Missouri. So I must conclude that the KA31 loop antenna is much much better than the whip antenna on the Sony 2010, on certain bands.

Peace
CB

I'm pretty sure that my MW distortion problem is related to the audio,
not the signal strength. I have no more distortion on my 1KW station
at 3 blocks, than I do on a 50KW station at 70 miles. It also seems
to happen on the weaker signals too.

Clyde,

It would appear your Sony 2010 is not working normally...the DE1103 is an awesome radio for the price (I own two of them) but it does not match the 2010's sensitivity.

From: pjcollradio
Topic: 176 Message: 176

Greetings, Purchased the DE1103 a little over a month ago and so far I feel that this is the best portable that I've ever owned. Previous portables I've owned include R/Shack dx360 & 390, plus a couple of Zenith transoceanics (G500 & H500). Can't realy compare the Zeniths to the 1103 as they are from a different era. The 1103 by far outperforms the dx360, the sensitivity is outstanding. Couldn't compare the dx 390 as I had dropped it on its head one to many times, it was my job site/shop radio. The 1103 with just the extended antenna does pretty good though not quite as well as my Yaesu frg100 with Endfedz antenna, 7 on the scale of 10. Will try the 1103 on an external antenna soon. Anyone have any sugestions concerning a moderatly priced external antenna that works well with the 1103?
Has anyone in this group heard anything about the DE1107 and how it compares to the 1103? Also looking forward to the release of the DE1108, whenever that might happen. Pleased to be a member of the group. P.J.Coll

I wonder if the audio section of the DE1103 is bad, audio distortions will shown up in all places(e.g. AM. FM, shortwaves) indiscriminately. Yet in your case it showed up only in certain specific frequencies/stations. Any idea ?
Nevertheless did you tuned other radio(including your car radio when driving arround town) to these questionable stations and never encountered identical problem(s)? --- may be their broadcasting transmitter(s) or you reception location is "bad" to begin with !
Can you give us more details and hope others can resolve this mysteries.

180. More on the DE1103 Audio Quality

Yahoo group: de1103
Date: 2006-03-13 01:33:38 UTC
From: gary_thorburn
Topic: 180 Message: 180

I'm the guy who posted the audio improvement mod related to fixing the apparently incorrect value resistors, R223 and R224. I've referred to this as the "KD1TE" mod, after my ham radio call sign. Since there have been some comments about 1103 audio quality in recent postings, I thought
I'd offer some more observations:

1) First, I wrote the file "audioMods-1103.txt" very carefully, please read it thoroughly once or twice before even considering the mod. If you are going to go to the trouble of checking for the incorrect resistor values and correcting this, spend $17 for the Kiwa audio mod parts and do that too. They provide good instructions for disassembling your 1103, and while you have the radio torn apart you might as well do all you can for its sound quality. Also, the KD1TE mod requires soldering to some capacitor leads which is more easily accomplished after the Kiwa mod is done. Remember that these mods should only be done if you are competent at fine soldering, and are willing to take some risk. I had to wear two pair of reading glasses simultaneously and use bright light to get the job done! These are not trivial mods.

2) I have only examined one 1103, so I have no idea how many radios have the incorrect resistors. Mine was purchased in November 2005, and a tiny square of paper in the packaging shows the date code "05 07 08", which is probably 8 July 2005. Some folks say their 1103 sounds fine. Perhaps these have the correct resistors, or maybe they do not, but the sound satisfies you. If so, enjoy your 1103 as it is! Often I find that radio fans have low expectations of MW and SW sound quality, particularly in an affordable portable.

3) Some posters have mentioned that the problem is only noticible on AM (MW). I agree, this is where it is worst. Here's why: The basic problem is that the incorrect resistors result in too high a level of audio input to the audio output chip (CXA1622P). R223 and R224 form part of a resistor network which reduces the audio signal level before it enters the CXA1622P. The higher, incorrect resistors result in more signal getting to the CXA1622P than the correct ones would. Whether or not this causes distortion depends on whether the resulting signal level exceeds what the CXA1622P can handle. I found that the FM signal level entering the CXA1622P is lower than the SW signal level, and the MW signal level is highest of all 3. So the distortion will be worst on MW (AM), while the FM generally sounds fine. I measured the signal levels at the "line out" jack on the 1103, which taps the signal BEFORE it goes to the CXA1622P. The MW signal is generally higher than FM or SW at this point. Incidentally, the line out jack will produce very nice FM Stereo recordings if

fed into a quality recorder, such as a good computer sound
card.

4) I found that the audio quality problem which the KD1TE mod corrects
could be most easily demonstrated by tuning to CHU or WWV, when
its signal is strong. Listen to the tone quality of the beeps. Then,
lower the antenna, or otherwise reduce the signal strength. I found
that the tone quality became more pure and musical at lower signal
strengths, presumably because it resulted in a lower audio level
entering the CXA1622P. If this were due to overloading somewhere
ahead of the audio circuits, the mod would not have made a difference.

Hello all!

I'm currently here in Hong Kong for a holiday till the end of the month & I'm taking advantage of this time by buying a few radio equipments and accessories.

I'm interested in the TG33 AM Active Antenna and also the DE31 SW Active Antenna but couln't find a good review on the TG33. Anyone here who's been using it can make some comments? Would really appreciate it.

Thanks in advance

Dennis

From: ndhr23a
Topic: 167 Message: 182

As a follow-up, I took the DE31 antenna apart and found that the tuning diode is shorted. I also bought a DE33 which is also not working as I expected it to, so it's diode may also be shorted.

Does anyone know a good source of these diodes? Apparently Digikey doesn't have these 1SV149 dsiodes or anything like them (30pF@1V-540pF@8V).

Since the tuning voltage on the antenna control goes up to over 13V with alkaline batteries and these diodes have a 15V breakdown voltage, doesn't that seem too close for comfort?? Should I have been using rechargable batteries with lower voltages?

I would send these back to China but I suspect the shipping will be more than the cost of the diodes and I don't want to gamble with getting another bad one.

Gary

I would say that the distortion is not bad, therefore many users are satisfied with the audio quality. I can live with it for now, and will do the mod eventually. There is no doubt in my perception that there is distortion and that the sound quality does not match the Kaito 1102 it replaces (may it rest in peace). In fact, I have a $14 GPX brand radio/flashlight with built in solar and crank generator recharger (bought at a local Menards) which has better AM audio quality than my 1103.

While I have done a few repairs on home audio equipment, I havent done any soldering on smaller component circuits. So I appreciated your warning on attempting this type of work. I also have the option of returning the radio to Kaito USA for replacement. There seems to be no garantee that the replacement will be an improvement however.

Thanks for all your input. It is much appreciated.

Paul

Hi,

I bought my KA1103 two weeks ago and installed the Kiwa mods. Mine had the "wrong" value R223/224 and I replaced them with 1kohm units. This makes a noticable improvement in the audio quality on AM. I emailed a note about the KD1TE mod to Craig at Kiwa and it looks like he now offers this mod for those of you who might want it but not like to do the work yourself.

For those who wonder if the mod will help with your radio, I urge you to try Gary's suggestions. Using an external amplifier, compare the audio quality of the headphone and line-level outputs. If a strong AM station sounds cleaner on the line-level output, then the resistor mod should remedy the problem.

any one of us could try an enphirical test on his own radio and share result with date of building. Should be easy so to identify the production months at risk. I have not the radio with me at the moment but later this evening will post my observation, (have had it for too few time and was not aware of the problems so cant say if it is faulty or not). As building date should be end of september 2005 if i remember right.

187. I Got It Today.

I received my new 1103 today, via UPS. I also got the KA-31 active loop antenna with it, but have not opened it yet.
I have to say, you folks were right about the 1103. It's qiute a receiver for the price. I think the LCD analog display on the front is very cool and the row of buttons, 1-0 is innovative and unusual. Of course I like the bandwidth switch, and other than the volume being a little wacky, I like the ergonomics. Just last month I bought the Eton E-10, which is a very nice radio, with a lot of good features, so I plan on putting these two little beauties side by side and having a lot of fun. I want to thank everyone here for their input, and I am certainly glad I joined. Thanks again.

Where is the date of manufacture stamped? I did not receive a small slip of paper in the box indicated the date as someone else posted earlier. I assume there is one inside the radio? (none in the battery compartment).

Mine didn't have one, either. It is probably part of the bar-code on the box, although I can't decipher it. Mine is 6 927674211034, and I got the radio on Christmas Eve. It might make more sense to work off serial numbers - I'd guess that mine is 11034. Can anyone confirm this?

I received the DE1103 on 20th december and it was manufactured in july 2005 according to the small label in the box. it does not seem to suffer the audio distortion problem. In fact the sound from the ear buds jack is about the same as from the line out jack.

I mostly listen to the ham bands and so far I have heard hams from 135 DXCC countries.

I had a thought on that mod- I haven't done it. Could you solder another 2k resistor in parallel and leave the original pieces in place?

As said I cecked the audio of mine wich is from september (date on a very small label in the box, if you are not aware you can skip it). I must admit that my ears ar not so educated but I dont find any distorsion. Instead the sound seem much more sharp than the sound of the 1102 I have. This last it's absolutely dumb even if it has the bas function on fm.

Paul,

I used surface-mount resistors, so they are probably
less than 1/8 Watt. Since 1/8 Watt, 1kohm resistors
can withstand 11 Vrms, they will work fine.

John,

That is the preferred method if you don't have access to good surface-mount soldering equipment.

A quick question: In these discussions of the audio circuit having the incorrect resistors in it, I'm getting the impression that these are Degen-branded units, not Kaito-branded models. Am I wrong in this? Are the wrong-value resistors as likely to be found in Kaito models as in Degens, or are Kaitos exempt from this situation?

Or maybe I am just *completely* wrong in this impression, and this problem is *only* showing up in Kaito 1103s? (I recall at least one post mentioning that the poster had sent his radio "back to Kaito" for a replacement due to poor audio.)

Hoping for enlightenment, Will

Hey Will, I have a Kaito1103 from sept 04 and no audio problems. Now I have just ordered from our good Friend Tao Qu a new DE1103(made this week). I hope this new one doesn't have any audio probs. I don't think that Kaito is exempt from anything that Degen puts out. Degen has a good name in China and want to keep it that way. Just my take on this, Josh

From: sneed_siding
Topic: 180 Message: 198

Will,

Mine is a Kaito purchased in the last two weeks. It had the "wrong" resistors before I replaced them. Personally, I don't think there's a manufacturing pattern here. I think the design was changed early on and that all DE/KA1103s now have the 2kohm resistors. Perhaps tolerances on IF filter alignment or AGC operation masks the problem on some receivers relative to others.

199. Poll Created: Audio Distortion Issue

Yahoo group: de1103
Date: 2006-03-14 21:50:01 UTC
From: dxgnome
Topic: 199 Message: 199

I created a simple poll to attempt to learn how many users do or do not have this problem, along with a manufacture date range for those who do (though I suspect most wont know when their radio was manufactured).

Please take the time to cast your vote:

http://groups.yahoo.com/group/de1103/polls

Regards, Paul

Well, I put my early unit ("04/05/03" or May 2004; purchased July 2004) down as "no distortion," although I have to switch DX/LO to LOcal for the MW band. Otherwise it does indeed overload all over the place (up to 4mHz in fact), here near a couple flamethrowers.

Stronger SSB signals will also sound distorted on occasion unless I engage LO.

201. 1103 FM Distortion

Yahoo group: de1103
Date: 2006-03-15 21:52:40 UTC
From: ray_ksw
Topic: 201 Message: 201

Hi all,

I usually just read the forums but was stirred to post after reading about the distortion problems being had by some.

Let me start by saying the 1103 Degen is such a good performer on Shortwave that I wanted to make sure I had 2 after having the first one for about 3 months. Both came from Tao Qu on ebay. Only great things to say about him! He has conversed with me a few times with my concern over a distorted FM issue. The remedy was to return it, but I couldn't part with it lol.

I was really hoping the 2nd one I ordered (both black which he said were the newer runs) wouldn't have the distorted FM. Its the same. FM is understandable, but has a distorted sound at any volume, any setting, any jack. I never run mine above 20 volume anyways but am disapointed that the FM isn't as 'crystal clear' as the AM bands. This radio is so sweet for AM an SSB that I just had to get another. I didn't get it for FM anyways, an I have 20 other radios to turn to for FM lol.

If anyones thinking of purchasing this for Shortwave use I must say you won't be disappointed. Its amazing for its size and price. On a Par EF SWL Antenna it keeps right up with my Yaesu 7700 easily. Its just that good. Best portable in my book. Even on the whip its an awesome performer. Internal battery charger and control layout are iceing on the cake.

And its strange how I've really seen no other posts about an FM distortion problem from others. Everyone says its FM is great so... maybe its just me. I'm honestly just happy it has FM so that when I get the itch I can switch to it an its there. Beyond that issue its a perfect little radio with big performance.

Back to lurking. 73s all!
Ray

FM on my KA1103 is sweet. No distortion at all. It does seem prone to some RF/IF overload though, and perhaps you are hearing that. If you lower the whip, does the distortion change?

Thats cool. Someone else pointed out that theirs has distortion on strong and weak signals. So it has yet to be determined whether the symptom is a cause of radio signal input overloading , or the input level overload in the audio circuit. Though the later is more likely we have a couple of users who state that things improved when adjusting those resistance levels to 1K.

There is no argument that this is a very sensitive receiver. I must say I'm impressed at the level of SW signals I'm able to pull in, in addition to and over what the KA1102 could.

Looks like I should of added the rest of 2004 months for options in the poll - I wasn't sure when production started for the 1103. Anyway, my suspicion is that most or all of these radios have the 2K ohm resistors, and as Gary Thorton pointed out, some of us may be a bit more sensitive to the audio quality than others; stronger AM signals may emphasize the issue; and given the tolerances of the components themselves (more widely spec'd) some units just may exhibit the problem more than others. I expect the poll to show very few users think there is a problem.

My recently purchased 1103 sounds very clean on FM, even at a volume setting up to 35. When I use the line out connected to a computer audio amplifier, it sounds great.
I would suspect that your's has a problem. I use mine around the house quite often.

Yes, I posted that before reading those by the more technically capable who had confirmed by substitution that there was indeed a component value error in some runs, which I apparently missed by virtue of having an early one (the 2d ver, I think). Indeed, my unit may have the problem too, which I've been blithely working around by fiddling the lo/dx switch.

I noticed in the poll there are dates for units with distortion but only a single option for "no distortion," which is why I posted my mfg date in the msg.

Though my reception has improved since putting a crude balun (75/300) on 30' eaves longwire, I have so much RFI in my apartment (50' from the power lines, and my unit is also the building's service entrance) it is hard to evaluate the receiver properly. (I'm also two miles from a 50 and two 10KW BC stations.)

During a neighborhood power failure one night last month, I got my only chance yet to fully enjoy the thing. Regrettably there's no backyard in my forseeable future.

Hi Tao,

The reports seem to suggest that. People are finding values of 2K for R223/R224, there's a copy of the schematic in the files area that clearly shows the values should be 1K. Those who have corrected those values report an improvement. Did you read Gary T. explanation?:

http://groups.yahoo.com/group/de1103/message/180

And did you have a chance to contact the engineer for his/her remarks?

Regards.

Hi friend,

I talked with designer already, but he has the fully different view, the R223/R224 is not related with the distortion, it is for the volume control using only...maybe the issue caused by the quality of CXA1622.

Have a nice day!

Best Regards,

I've place .pdf of the datasheet for the CXA1622P audio chip in the files area. My circuit analysis is a little rusty, but it appears that R223/224 (from the schematic) are part input signal circuit to pins 1 and 16 on the CXA1622P. Pin 14 controls volume. Too high a signal level could be overloaded (though slightly) the pre-amp input of the audio chip. Some chips in some radios (maybe most) may have tolerances to accept that.

Gary? Anyone else?

In other words in case even if "extreme" strong broadcast signals failed overloading the frontend yet over driving(overloading) the AF amplifier is still remaining problematical. Again we should go back to square one.--- i.e. for most of us it is easier to cutdown (attenuating)the radio broadcasting signals at the "antenna" end rather than taking the radio apart--- modifying the AF circuitries --- to solve the problem(s). Any idea/suggestion ?

AGC should deal with those signals. There would also be lots of interference
and spurious signals from them, which isn't happening.

Despite the DE1103's performance is much better than most receivers
of its class yet in the real world its AGC's dynamic "controling"
range is not really "Smart" and still leaving much to be desired. My
point is if those "not-so-strong" FM, shortwave broadcasts do not
cause any AF destortion problem, cutting down/attenuating
those "Very" strong AM broadcast signals feeding to the radio front
end should be quite straight forward and effective. --- even at the
expends of sacrificing the reception sensitivity to a certain
degree. Moreover most spurious signal interferences are caused by
the none linear radio front end overloadings too.
As a matter of fact almost all professional grade communication
receivers are not completely depending on its sophisticated AGC
circuitries to avoid such problem(s). They still provide independent
manual controls --- RF/IF attenuations/gain controls --- to prevent
RF overloadings. True ?

Well, I might know something shortly; I broke down and ordered a 3.5mHz filter from ICE Radio Products (via qth.net) (for $28+7), which seems reasonable due to my residence within 3 miles of 3 or 4 BCBs, and recalling all the whining I've made here about RFI.

I was tempted to go for the 500-1800kHz notch but looking at the graph decided I needed to really knock down the whole BCB, and out here there's just no LW to hear anyway. While I only suffer images up to 4mHz, the overloading may adversely affect performance further up where I am interested (i.e., swamping).

(I realize this $35 gizmo will not emulate the lovely RFI-free night due to power failure I enjoyed two months ago.)

> As a matter of fact almost all professional grade communication
> receivers ... still provide independent manual controls --- RF/IF
attenuations/gain controls --- to prevent RF overloadings. True ?

Well, they did last time I worked around such. They put an HF xcvr on the bridge so they didn't have to rely on us patching something up from the shack, and the non-radiomen up there were using the RF gain as a volume control. I couldn't get the ET's to remove the knob, and the bridge gang wondered why they couldn't hear calls.

I notice the Lo/DX switch is inside of the RF stage both on the whip and ferrite bar, so folks suffering overload in those stages will need to resort to the ext ant jack.

J.

Hi Tao,

I would imagine that adding resistors and having an improvement in audio would be be pretty definitive proof. You could call it a refinement in design or an error in manufacturing but it's probably apparent now that this fix works.

About the audio distortion issue.

I am fully convinced that the input to the CXA1622P was being overloaded in my DE1103. Please refer to my post on 13 March 2006, and my uploaded file, "audioMods-1103.txt" for information on how I came to that conclusion.

The suggestion by dxgnome, that perhaps some CXA1622P chips overload more easily than others is an interesting one. Or, it could be that some runs of the IF/Detector chip that feeds it produce a higher output than others. The acceptable tolerances for chips produced for inexpensive consumer goods may be quite loose.

My conclusion that R223/224 were the "wrong" value is based on the fact that the actual resistor values in my radio differ from that shown on a schematic of the DE1103 which appears on a Russian website, and that changing it to that value solved the overload problem in my case. Furthermore, it was clear to me from the schematic that reducing the value of that resistor would indeed reduce the signal level getting into the CXA1622P, so it made theoretical sense.

Let's remember that Degen is not obligated to build their radios to the specification of a pirated schematic on a Russian website. While I suspect the resistor substitution is an error, Degen may have had other reasons to change it.

Finally, others have commented on front-end overload problems, and FM distortion problems. My experience is with exactly one DE1103 and I have experenced none of those problems. Recordings made through the line-out jack of my DE1103 sound super. The line-out jack is taken after the Toshiba IF/Detector chip, but before the resistor network which involves R223/224, and is fed thru yet another stereo audio chip which exists only to amplify the the line-out jack. Frankly, its amazing that Degen would include the circuitry and jack for the line-out feature in such an affordable product. But I'm very grateful for it.

If there is interest in the audio quality at the line-out jack, I will place .mp3 recordings taken from this jack in the files area IF SOMEONE ASKS ME to do so.

Hi John,

Please make sure the following (approx.):
R224 + R228 = 5K
R223 + R226 = 5K

Consider add the RC network around R226/R228 to improve the audio base quality?

From: stelug
Topic: 180 Message: 219

Gulp!?!? Too difficoult for me, and hope some others, non techincal
neither orientend-educated elecronical minds. I wish at the end of
this interesenting tale one of the boss here can explain in few words
what to do in case of overloading
Retract the wip antenna
Try another distant source
Ask, prey, pay & corrupt a tecnician for the mod
Crosfingers and hope.
Just teasing but, rearly a plain explanation is whelcome.

I have to add my agreement with Gary here. I think there is too much speculation about this issue when in fact, the hypothesis is easily tested. If distortion exists at the speaker and/or headphone output and doesn't exist in the line-level output, then the distortion is generated by the CXA1622-associated circuitry, which includes R223/224. Changing the resistors is the simplest remedy.

One other factor here has occured to me: In judging the outputs, I am using the KA1103 with the supplied Nimh batteries, which have lower voltage output than alkalines or the AC adapter. Perhaps the CXA1622 has better headroom with the AC adapter and so might not exhibit the distortion when tested that way.

After performing the resistor mods and the Kiwa capacitor mods, my KA1103 is a very good sounding radio. FM outputs are superb. The AM outputs sound much more natural and intelligible than my Sony ICF-7600GR in side by side tests with the internal speakers.

Hi,
I have owned a early 1103 that suffered from the tuning/volume knob problem, this was unit was kindly changed almost a year later by my dealer(Durham Radio) to a much later one a few months ago, I can say without any hesitation that the AM on MW is most definitely distorted compared to the older unit which had very clean sounding AM.

If I have a chance next week at work I will do some distortion measurements relative to input level at both the headphone output and line output.

From: Kenneth Lee
Topic: 167 Message: 224

I did a google on "diode 1sv149" and saw this diode is popular in some of the Radio Shack radios, maybe you can get it there. Also got a hit on something for the Elecraft transceiver kit. But one of the most interesting things I found was on a web page for DRM, have a look here: http://www.drmrx.org/forum/archive/index.php/t-1210.html

If the link doesn't work, just try the google on "diode 1sv149"

Regards, Ken -N5SWR

To: de1103@yahoogroups.com
Subject: [de1103] Re: DE31 antenna question

As a follow-up, I took the DE31 antenna apart and found that the tuning diode is shorted. I also bought a DE33 which is also not working as I expected it to, so it's diode may also be shorted.

Does anyone know a good source of these diodes? Apparently Digikey doesn't have these 1SV149 dsiodes or anything like them (30pF@1V-540pF@8V).

Since the tuning voltage on the antenna control goes up to over 13V with alkaline batteries and these diodes have a 15V breakdown voltage, doesn't that seem too close for comfort?? Should I have been using rechargable batteries with lower voltages?

I would send these back to China but I suspect the shipping will be more than the cost of the diodes and I don't want to gamble with getting another bad one.

From: ppasteur
Topic: 226 Message: 226

I am wondering if they have had a bad run of these units.
I got a domestic version of the 31 and bought a 33 from China. After the good reviews of these units, I have been very disappointed. I have tried them on a Kaito 1103, a Sony 760GR an ICF-2010 and the ATS 909. It seems that they do not produce any better results than the internal antennas on any of the machines, actually they are worse. The CCrane dual ferrite MW antenna absolutely makes the 33 look like it is not even connected. Further, the tuning wheel on either of the antennas does nothing.

I have not pulled them apart yet, but I have to assume that my units have this shorted diode problem as well.

I saw a link to the schematics for the 31, but now seem to have lost is. Can anyone provide that link please.

Topic: 226 Message: 227

When I first got my DE-31 it worked great, but after a couple of weeks it only worked intermediately. The connection to the loop (where the mini jack plugs into the bottom of the loop) was very loose and would not even hold the plug in place. I removed the four small screws and bent the springy tabs down so the connector now holds the plug snuggly in place and the antenna now works great. Actually I have to thank my wife for fixing this, I am blind and she did it for me.

228. DE 1103 DE 31

Yahoo group: de1103
Date: 2006-03-20 07:30:26 UTC
From: kitkatjt
Topic: 228 Message: 228

After reading the many post about the problems with these products I wonder how many are real or something else. There are people who would not be satisfied with any radio or ant who enjoy net talking. There are others who enjoy altering radios and often regret the outcome of their toying around.These often make many returns to the radio shack for parts before they fix what they have already fixed.The outcome is often a flop. The DE 1103 is not made by the gods so with time new mods will hit the market.If the audio is so bad why are people buying these like crazy? The DE 1103 is a great radio at any price and gets an A+ from me.I like what I hear without toying around with mine. I will continue to read the mail about the DE audio threads but remember some may need a hearing aid to clear up their audio problems.Are their audio problems with some you may say yes but overall people seem to be satisfied.We need some new threads started about sw listening or hints about using the DE 1103. Are you tired about the audio rut threads I am.You might beware of some of the DE solutions offered on the net.

229. Audio on 1103

Yahoo group: de1103
Date: 2006-03-20 17:24:01 UTC
From: wgmartin999
Topic: 229 Message: 229

I'm beginning to wonder if the audio distortion might be in the actual speaker itself in at least my 1103. I definitely hear a "roughness" or "fuzziness" of the sound in the 1103 that isn't there if I have the same signal coming in on another radio right next to it. For example, I have a Grundig Satellit 800 as my main bedside radio, and the 1103 hooked to its external power supply (so weak batteries can't be an issue) there too. I tune in the same station (FM, AM MW, or SW) on both, and vary the volumes on each so it is like a stereo signal and I'm moving the balance control. Even with the audio level fairly low (so I'm not overdriving the 1103's speaker), there is a definitely-more-distorted sound from the 1103. Of course, this is an "apples & oranges" comparison, with a much larger radio with a bigger speaker. I wouldn't expect the 1103 to sound as good as the 800 does.

If I plug decent headphones (Sony's) into the 1103, I get a much cleaner sound than listening on the speaker. (By the way, I also tried the headphones in the "line out" jack, and, while the audio level is pretty low, it is also a clean-sounding signal.)

Maybe we're expecting too much out of a small speaker in what is really a fairly low-cost radio? The 1103's RF performance makes it well worth while, even if the audio has problems.

73, Will

I could not agree with you more. My DE1103 is 2 years old and it's great. There is no hint of a problem with it and I have it hooked to a 30 ft piece of wire in my study with the computer monitor next to it. It works fine. I keep it on local to prevent possible overload that's it. I get great sound and reception on all bands. I get no interference from my computer. It's just a good sounding well built radio. I supect that those who have no problems are just keeping quiet so the complainers can complain about something. Nothing is perfect not my 1103, my E1XM or my NRD-535D, all of which I use daily. They are just good well built radio's. If the 1103 breaks, i'll buy another one. If the E1 or 535 break i'll cry and get them fixed. It's really that simple. If you have a 1103 that works well, lets hear from you. I to grow tried of the complaints. Let's sing songs and tell tales of the little radio that could and does! No offense intended, just my take on the situtation.

Mine works very well, also.

Leon

I recently listed this little guy on ebay if anyone is interested. it's clean as a pin. I've seen postings here about these. I have an 1103 and it works great with a long wire. The scuttlebut is that you can tune a screen door with one.

The FM an SW are basically fine on mine, just the AM MW. At low and high audio levels, speaker or headphones, there is some distortion. And the are at least a couple of reports that doing the resistor change has corrected or improved the sound quality. So it's not the speaker. And Gary is right the sound quality (at least on our radios) is not as good as that of the KA1102.

I agree with you on two points: 1) The DE1103 is a fantastic radio, comparing favorably to $200-$300 competitors. 2) The DE1103 is not perfect. Those of us with the inclination and aptitudes for modifying circuits are using this forum to discuss improvements and results. Personally, I am in this forum to share technical information. I would go to a more general forum for tips about DXing, etc. I disagree with your claim that this forum is full of complaints and problems by people who ineptly hack their radios!

At least some DE1103s have been objectively observed to distort in their audio stages and a simple fix has proved effective. No one has proposed that you have to be unhappy with your radio. If you don't like the technical threads, then the best solution would be to start a new thread that interests you, rather than insult some of us as being deaf, complaining, inept, dissatisfied hackers.

236. RE: [de1103] Digest Number 49

Yahoo group: de1103
Date: 2006-03-21 02:07:17 UTC
From: ppasteur
Topic: 236 Message: 236

I got the TG31 working. I found what I thought might be a solder bridge on the loop board and fixed it. The antenna now is working. I don't have anything like it to compare it to, but it does definitely add signal strength to any signal that I have tried it on so far. I think I will purchase another for a friend who I gave a Sony 7600GR to play with.

As to the TG33. It works as well. I was trying to use it plugged directly into the AM antenna inputs on the three radios that I used it with. Apparently none of them actually take MW signal input from this jack.

After some kind advice by Mr. Tao Qu, I tried using the ferrite attachment to transfer the signal to the internal ferrite MW antenna on the radios. This worked as advertised. I will be running a comparison between the TG33 and my CCrane dual ferrite active antenna. It may be off topic for this list, but if anyone is interested please let me know and I can post the results.

Phil P.

From: "ppasteur" <ppasteur@...>
Subject: De31/33

I am wondering if they have had a bad run of these units.
I got a domestic version of the 31 and bought a 33 from China. After the good reviews of these units, I have been very disappointed. I have tried them on a Kaito 1103, a Sony 760GR an ICF-2010 and the ATS 909. It seems that they do not produce any better results than the internal antennas on any of the machines, actually they are worse. The CCrane dual ferrite MW antenna absolutely makes the 33 look like it is not even connected. Further, the tuning wheel on either of the antennas does nothing.

I have not pulled them apart yet, but I have to assume that my units have this shorted diode problem as well.

I saw a link to the schematics for the 31, but now seem to have lost is. Can anyone provide that link please.

Phil P.

As a follow-up, I took the DE31 antenna apart and found that the tuning diode is shorted. I also bought a DE33 which is also not working as I expected it to, so it's diode may also be shorted.

Does anyone know a good source of these diodes? Apparently Digikey doesn't have these 1SV149 dsiodes or anything like them (30pF@1V-540pF@8V).

Since the tuning voltage on the antenna control goes up to over 13V with alkaline batteries and these diodes have a 15V breakdown voltage, doesn't that seem too close for comfort?? Should I have been using rechargable batteries with lower voltages?

I would send these back to China but I suspect the shipping will be more than the cost of the diodes and I don't want to gamble with getting another bad one.

To me the 1103 does not seems so distorted, but I have not as good ears like You all, and then cause I use the radio mostly for news and speaking programs, as soon I can undestand fine whats going on I am satisfied. Comparing with the 1102 yes, the second seems to have è better sound but its resemble more a digital thn an analogical sound (thats my personal impressions) 1103 is defintely wharmer and loud, and less tiering

I am afraid that I don't understand, though I have seen this go on with posters to lists concerning everything from telescopes to automobiles. People seem to take affront when anyone has a problem with one of their prized possessions and has the temerity to ask for help in fixing it.

I just joined this list recently, but I have read every message posted since the list was formed. Most all of the posts are highly complimentary of this radio. In the main I agree with all of the positives. I am quite happy that many, likely most, are happy with their radios. I am happy to have read all of the glowing reports. Indeed, this is why I bought mine.

That having been said, the sound on my unit through the speaker or headphones is pretty dreadful. This is not imagined, it is a fact. I am quite happy that I came here and found a discussion of the fact that "SOME" other people were experiencing the same problem, and to learn that there is a potential fix. Part of what most discussion lists are for is to sing the praise of some specified items so people know what is good. The other part is usually to help people work through problems that they may have with the same items.

This discussion about lousy sound quality has nothing to do with putting down the DE/KA1103 radios in general. No one has told people not to buy one, quite the opposite has happened actually. So I would suggest that all of the folks that are blessed with a radio that works properly be thankful for that, and that they show tolerance for those less fortunate. I did not ask to get a sub-par example of this otherwise fine little radio, I just happened to get one with a documented (though perhaps not well understood) problem.

This is not a contest between those that are satisfied and those that are having problems. The fact that your radio, and ten thousand others work perfectly is a great testimony to Degen, and it is laudable. The thing is that, all of those perfect radios don't help me a bit when I get one that has problems. I do not consider my asking for help, and in doing so reporting the facts as I see them in order to describe the issues, to be "complaining". Perhaps if everyone saw the discussion as a rational process of pursuing a fix to a very real (to me anyway) problem, it may not seem quite so inflammatory to them. This would hopefully allow them to save their emotional energy, and to allow others the freedom to seek help without having to defend themselves in the process.

I personally am going to order the KIWA mod kit and add the resistors, as listening to my KA1103 as it is now grates on my nerves and makes an otherwise great little radio pretty useless to me. The only way that I can listen at length to the radio is from the line output using some small amplified speakers. This way it sounds quite good, but it defeats the

purpose of having a highly portable radio.

If anyone thinks I am imagining the problem, or just spending (wasting) my time posting for no other reason than to "complain"...I will be happy to swap radios with them. Perhaps then they would not be so quick to criticize...

> Are you tired about the audio rut threads I am.

We're trying to diagnose an apparent production run glitch. Those who are sufficiently capable and bold to modify their units (as hams are wont to do) are giving us useful info; many who wonder if their audio is below the quality others are enjoying will gain useful guidance whether to seek a warranty replacement or attempt a kit mod.

That's what a support group is for.

Also, a poster here seems to be with or close to the mfr, and is gaining valuable feedback on their mods and QC.

(One can no longer hot-rod a car--at least not the engine, if it requires a license--and it's been a decade since I dared take a soldering iron to a computer. If I wasn't wearing bad bifocals and the 1103 wasn't so tiny, I'd have been in there already.)

BTW I apologize for repeatedly suggesting people use their Lo/DX switch to overcome the distortion; while it will help in some situations, after reading Wilkins' post (who had both an early and recent version) I realize I'm probably not hearing the problem to the extent some are because I have an early unit myself.

P.S. ICE's model 400 BCB filter arrived a few days ago, but I haven't had a chance yet to do with/without comparisons to determine if those spurious signals I'm hearing are images or harmonics. (I live close enough to the stations that they might well be the latter.)

Regards,

Jeff

One thing to bear in mind when comparing the 1103 to other sets is, being intended for SW reception, it has a fairly narrow bandwidth. While the specified 6kHz in "wide" ("narrow" is 3kHz) should be sufficient for what US broadcasters are putting out these days (only 5kHz--it's a long story and has to something do with IBOC sidebands), it might be a bit narrower and sound a bit dull compared to a different set.

A while back someone mentioned the lack of brightness on MW on his 1103 and I recalled the old analog-radio trick of offset tuning slightly to get more of one sideband through. The 1103 is uncommon in tuning MW in 1kHz increments, so this makes it a rare modern radio one can do this on. I tried it, found it did crisp up a couple stations, and suggested he try tuning 2kHz high. He reported being pleased with the result.

Actually, the narrow setting is 4kHz, according to the user manual. This distortion issue has nothing to do with the bandwidth. The quality of the SW bands, for what it is, is very acceptable, better than the 1102 IMO. The is FM is very good, if not just a bit hollow thru the internal speaker. And the 1103 seems even a tad "brighter" than the 1102 on the "wide" setting - although without having them side by side, it's a judgement call from memory. My issue is with the clarity on AM MW only, the raspiness/coarseness in dialog, thru the internal speaker or ear-buds, that I never experienced with the 1102 (except on FM and very very low volume setting listening thru the ear-buds). It's not bad, but it's enough to irritate me.

In fact, it was based on the 1102's performance and size that, along with the majority of very positive reviews on the Degen/Kaito radios in general, led me to purchase another Kaito to replace my lost KA1102. I decided on "upgrading" to the 1103 strictly for the improvement on the SW band reception - and that has not disappointed. I did expect equal, or better, audio performance given it's slightly larger size, which has been mixed.

For the price, and for what it does, the 1103 is a nice little radio. It's not perfect, but no radio is, or will there ever be one. If I thought it fell short in value/performance, I would not hesitate to send it back and get something else (another Ka1102 perhaps). For now I can live with the AM MW issue. I'll probably end up doing the mods, but I like to exercise some patience and find out what others are experiencing. So far, there is at least a few users the confirm the audio distortion which can remedied by the mods that have been mentioned.

I've tried the off tuning to either side of a broadcast frequency, and always end up leaving it on the exact frequency.

FWIW,

Paul

I never encountered any problem with my DE1103. Personally will rate the DE1103 be better than most "post world war 2" era communication receivers. (As a reminder: those receivers cost thousands dollars to build !) Yes, did encounter overloading from certain "Very-strong" stations. However succeeded to resolve the problem after switching the attentunation control to "local", shorten/remove the wire antenna ....or employing other "tricks". Nevertheless, what I am talking about are suggestions for others "extreme" cases so that people may trace(and solve) the cause of the Audio distortion problem (s). My suggestion for the future feature will be adding a station tuning speeds switch/knobs (e.g. Fast and slow rates --- coarse and fine tuning) It will be very helpful when searching stations in the shortwave bands.

I contacted Tao Qu about the problems and he was quite helpful and willing to send me a new diode for no charge. However, when I removed the diode to verify it was bad, I determined that the problem was conductive residue on the circuit board and not the diode. After soaking and gently brushing the board with isopropyl alcohol the "short" was removed and after re-installing the diode, the DE31 now works great! My reception is substantially improved over the whip.

Tao Qu also informed me that I should be using the ferrite coupler for the TG33 antenna with the DE1103 and everything appears to work correctly now.

Thanks, Tao Qu for your customer support!

Kitkatjt,

I made an offer to swap with anyone interested in hearing what I am hearing when using my KA1103 on MW. I am sincere, but hardly amused!

My radio is pristine. It has maybe two hours of use on it. It is the silver model and has all of the original equipment including the English manual, wall charger, 4 NiMH batteries, carrying strap, velvet pouch and with full one year warranty. I even have the original box, packing list, and receipt.

I am willing to swap for one of yours that you feel works well. I can hear what you think is a good one sounds like, and you can hear one...that I judge to have the problem being discussed.

Perhaps then, you can tell me I am nuts...and that my radio is as good as it gets. Possibly I get to tell you that your radio has the same problem, but you just don't listen as critically as I do. Either way, we understand what the other is talking about. In any case, if you feel that I am just imagining all of this to have something to complain about, you can't go wrong. You get a brand new radio for one of your more heavily used ones.

Please write me directly if you really want to hear the MW audio defect first hand.

Phil P.

I would like to hear the radios you all are writing about. I have two DE 1103s that are perfect. I am reading and just entertained. [:-B]

Let me tell you all that I have dealt with three radio dealers from China, Mr. Tao Qu is the best there is! I just got my new 1103 from him today. I thought there might be a problem with the shuttle knob, tighter than my Kaito. I asked him and he replied that they have a new supplier (APLS) for that part. Good guy can't say enough good about him. Glad he could help you as well, Josh

249. Production Line Performance Test of 3 x DE1103 units

Yahoo group: de1103
Date: 2006-03-25 03:24:53 UTC
From: John
Topic: 249 Message: 249

Hi to group from John in Australia.
I have uploaded to Files an Official Performance Test Report made at Degen factory.
It's a Google translation from Chinese so needs a bit of working out when reading it.
I've had my radio more than a year and there is no evidence of any distortion .
I've owned a number of portable PLL multiband radios in past and can say for me the DE1103 is overall a better performing radio
My prior radios :- Sangean ATS 909 ATS 803A ATS 606A Sony ICF 7600GR .
Comparisons to my above radios made as stand alone using no external antennas .
Whats the point of having a Portable radio that can't perform well unless it needs external antenna --no lomger a Portable radio.
The only other multiband radio I have is the DE1107 analogue radio which is very close in performance to the DE1103. I have found that the DE1107 is slighty more sensitive on some SW bands compared to the DE1103 .
Regards John from "Downunder"

250. Audio Mods...They WORK !!!

Yahoo group: de1103
Date: 2006-03-26 02:24:43 UTC
From: ppasteur
Topic: 249 Message: 250

Hello All,

I got my kits from KIWA today. I purchased the audio mod kit and the diode protection for the telescoping antenna kit.

The audio kit consists of 7 capacitors. 6 capacitors are replaced and the seventh bypasses a large cap.

The diode protection is 4 diodes that claims to protect the radio from ESD, either from the operator, or if one uses an outside long wire antenna clipped to the whip.

Craig at KIWA also sent the some 2K Ohm 1/8 watt resistors to perform the KD1TE resistor mod. He did not even charge me for them...talk about service!!

The whole process took me about 3 hours. It is not that it is all that difficult, it is just that I was working very carefully and methodically. Someone with better skills and a higher confidence level could probably do it in an hour or so.

So what did I accomplish? The radio sounds like a completely different machine. All bands sound much better. Intelligibility has increased by an order of magnitude. All traces of distortion (at least up to the "20" volume setting) have vanished. I can now listen to the radio without it grating on my nerves. It is very pleasant to listen to, in fact.

It is not clear which audio mod cleared up the distortion, but based upon Gary's findings, the KIWA audio mod is not enough by itself. The KIWA mode clean up the audio quite a bit by changing the frequency response . Apparently better frequency response is not enough by itself. If the audio section is being over driven, one still gets the fuzzy, distorted sound. The KD1TE resistor mod reduces the drive level to the audio section input. This seems to be the key in eliminating the distortion.

Anyway, if a person has the skills, it is the best $17.00 they could spend on this radio. Even if they send it to KIWA and spend the $50.00 for them to do the mod, (they do both the capacitors and the resistor mod, if needed) I would think that it is still well worth it.

I have appreciated the little KA1103 for its price, features, and performance up to now. After the mod, I can actually enjoy listening to it on MW (which is where I do 70% of my listening)!!!

Phil P.

I definitely afree wholeheartedly!!! When he saw my posts about having problems with the DE 31 and 33 active antennas, he sent me an email asking if he could help...and offering warranty replacement.

We worked out the problems with the antennas, one I fixed, (solder bridge), the other he pointed out the fact that the antenna input jack would not work for MW.

In any case, he apparently cares about he customers. I would deal with him again anytime!!

253. Jog Dial

Yahoo group: de1103
Date: 2006-03-26 13:25:03 UTC
From: Thad Larson
Topic: 253 Message: 253

So far, I am happy to have bought the DE1103 (last year). I use it primarily for SW at night and listening to non-hurricane related broadcasts after a hurricane has passed. Since this is the only SW radio that I own, I can't compare it to anything else.

The jury is still out (for me) concerning the audio quality. The speaker sounds rather "chinky", but I blammed it on the small speaker size. I will probably run the two audio outputs (headphones / line out) to the computer input and amplify the sound from there.

Before I put my radio on the operating bench... I remember a lot of comments about a bad jog dial, but I never remember that anybody had a solution. I threw a bunch of electrical tape around the dial pot thinking that one of the two "bit wires" were grounding out on the shield. Now the problem is re-surfacing again after a two-month hiatus. Now it alternates between '0' and '1' as I turn the dial. Guessing that the dial works on a gray-scale type method.

Does anybody have a solution to the jog dial problem?

TIA,
Thad

Thad,
Sorry I don't have anything for you on the jog wheel control problem.

A suggestion for auxilliary sound. I just had a pair of "CHEAP"...and I mean like $6.00 amplifies computer speakers around. I hooked them up to the line out and it actually sounded pretty good. I would imagine, if you had something similar, you could swap them between the headphone and line out jacks to compare the sound. If you adjust the volume level so the outputs are equal, it could be telling.

Better speakers may be more revealing. In my shack I have all of the radios plugged into an old receiver driving a couple of RS two way six inch speakers. You could use someting with a reciever...all you would need is a mini plug to two RCA plugs adapter.

Good luck with the jog wheel!

Phil P.

255. Hand Strap ???

Yahoo group: de1103
Date: 2006-03-26 18:49:39 UTC
From: ppasteur
Topic: 255 Message: 255

For you folks that have had the DE/KA 1103 disassembled, is there a place inside the radio that the small loop part of the hand strap loops around inside the radio, or is simply the friction fit between it and the radio halves all that holds it in?

After I had reassembled the radio...working marvelously now !!!

I noticed I had not installed the hand strap. I did not pay attention to how it was installed when I took the radio apart... I am not convinced that I even need the hand strap, but would like to know how it should be installed anyway.

Any help would be appreciated greatly!!

Jog wheel is sorts of mechanical digital switches. It is not an expensive item. Like the tire of your car after it worn-out by long use the only resolution is replace it with a new one. Recently someone mentioned "ALPS" is the jog wheel supplier for the DE1103. Nevertheless why not ask Tao Qu. Believe he can help you out. Hope it helps.

From: Don Butler
Topic: 255 Message: 258

Phil,

Yes, there is a post just inside the radio where the small loop on the hand strap fits over and then the radio is reassembled. Took mine apart to repair the whip and then replaced the hand strap and reassembled the radio.

OBTW.... I bought a pair of Yamaha computer speakers at one of my local goodwill stores and run them from the line out jack. Very impressive sound! The Yamaha's are model YST-M10 and they rate them at +/- 3 DB from 85 to 20k so pretty good response for a small speaker system.

Had my radio for about a year and a half now and no problems with it except for me. I broke the back stand off very early on but don't really miss it now. ;o)

Yes, knyuen88 is correct! -:)

But please pay more attention the jog wheel on old version and new version are fully different, and the pcb are not same, so can not cross replace directly!

I am not sure if has many friends here has the problem on jog whell, whip antenna and the rear support stand?

knyuen88 <knyuen88@...> wrote:
Jog wheel is sorts of mechanical digital switches. It is not an
expensive item. Like the tire of your car after it worn-out by long use
the only resolution is replace it with a new one. Recently someone
mentioned "ALPS" is the jog wheel supplier for the DE1103.
Nevertheless why not ask Tao Qu. Believe he can help you out.
Hope it helps.

You might be too close, and the signal is overloading the radio. Rotating
the radio so that less signal is picked up by the internal ferrite rod
antenna might help.

263. FM Reception?

Yahoo group: de1103
Date: 2006-03-30 17:56:12 UTC
From: jlochey
Topic: 263 Message: 263

Group,

I am curious.

I love my 1103 and was wondering how it compares to other radios for FM reception?

I like to do a bit of FM DX'ing, very low key, nothing serious.

But of all the "portable" solutions out there for FM reception, has anyone found anything better then the 1103?

Thanks,

John
KC8JDI
Michigan

Topic: 263 Message: 264

I've found the FM reception to be outstanding. Both the selectivity (a very crowded band in Los Angeles) and sensitivity are exceptional. When I use the line output into a good amplifier and speakers, you would think it's a component tuner.

Daba Zeta,

Well, you are probably right. The KA31 is definitely much quieter
than my 50 to 75 foot random wire. The more I switch between the two,
the more I notice that.

I'm very content with my 1103 in all aspects. I will not be buying
any more radios. Wellll, when the Degen 1108 comes out, I will
probably line up for that one. :-) Especially if I can buy it on Ebay again.
How do people get one cheaply if they aren't members of Ebay, but
want to buy at Chinese prices?

Peace

From: Jay
Topic: 261 Message: 266

You may be in a spot where phase cancellation of a direct and a reflected signal is causing the distortion, or you may be in a bad spot of a directional station. I work for a directional AM station, and as I drive the local area there is one spot where the signal is all distorted and garbled for several seconds all the time...it sounds phased out.

Check with Lypin on a DE 1103 on ebay.It has the updated corrected
audio.You can save a bunch of money too. I have bought two from him and
they are the latest ons that sound great. He stands behind his radios
and has 100 on feedback.I can not see buying a radio here that you can
get for alot less that comes with a war. also.

Folks,

I agree totally in buying stuff form Liypn. It's always the very latest production and prices are about half what the imported versions cost. However, you must be aware that your warranty is less valuable as shipping to and from China often exceeds the cost of the unit. So, in effect, you are providing your own warranty based on your initial savings. If it costs, say $15 to ship an 1103, it will cost you that much to return it for replacement.

I think this trade off is well worth it...I have purchased over 20 radios from Liypn. The one bad one I received, though, I just kept as a parts radio...it wasn't worth sending it back.

From: Joe Neumayr
Topic: 272 Message: 272

Hello

I just received the DE1103 and I love everthing about the radio with the exception of receiving SSB. When I tune using AM I can hear SSB stations. When I press the SSB button, the radio goes almost silent. If I turn the volume up, I can hear faint sounds and some popping sounds. The meter show a signal. The fine tuning does not have any impact. I've had many shortwave receivers to know that SSB is not working correctly. Now I'm wondering if the SSB capability can be easily fixed or if I need to send back to Hong Kong for replacement. FM and AM tuning is working just fine. I've tried the reset with no impact. Please let me know your thoughts on why the SSB might not be working. Thanks for the help in advance.

It sounds like the carrier insertion oscillator isn't working, probably a
duff solder joint. I'd contact the supplier.

Before sending it back better double check if it really the radio's fault. Can u use the SSB mode to zero beat any known frequence local AM broadcast station? (tuning the radio up/down a few Khz using the main frequency tuning - not the SSB fine adjustment knob) If you can likely the SSB function is OK. Or you may use other radio to pick up the same unknown SSB station and confirm if it is really a SSB transmission at all. Suspect those signals may not be a SSB station but some images, overloading, stray signals, or whatever mysterious transmission modes from some unexpected sources. Please let all of us know your findings. Good luck !

knyuen88, Leon and Joshua;

Thanks for the feedback.

After work, I messed around with the SSB function of the DE1103. I tried tuning up and down the AM Broadcast band with the SSB button on. I could here stations very faint and muted in the background as I tuned. I also tuned strong SSB stations in on my R-5000 and could not get the SSB to work on the DE1103. The SSB stations were mute and in the background with the fine tune having no impact.

I hit the reset button just to see what would happen (I had hit this button in the past with no results). When I went to the AM Broadcast stations and hit the SSB button, I had volume and could here that distinctive sound of being in SSB. I tried the fine tune and it worked for a short period. What happend next is that there was some crackling and popping as the radio volume stepped back to that muted condition with a low volume. I hit the reset button a couple time more, but could not get the radio to work in SSB again. I'm wondering if I not dealing with a cold solder joint as suggested?

Thanks again for the input. This has been a very helpful forum and is the reason why I purchased the radio.

If you set it for AM and tune to a frequency where there is no signal, and switch to SSB, the noise should sound markedly different if the CIO and/or product detector are working properly.

Sounded like in the SSB mode the DE1103 automatically switched to
the "Mute" mode. If this is the case "Reset" it to the "default"
settings should work (in theory !)--- yet you already tried
nevertheless -- may be you can try a last "trick" before sending it
out. Remove the batteries from the radio. Hopefully those
internal "Very" high value memory storage capacitor(s) will be
discharged completely overnight(s)and clear all previous mess
of "wrong reset"s in the microprocessor's memories. Put them back
and see if it did really "reset" days afterwards. I did
such "reprogramming" for my Toyota (Not DE1103 though!) to reset
my "Check-engine warning light" and works ! Good luck !

Tune around 7000-7300 MHz and you should hear plenty of amateur CW (Morse) and SSB (single-sideband) signals. You need to select SSB and fine tune the signal with the vertical pot on the side of the radio. SSB is transmitted with a suppressed carrier, and the receiver has to insert the carrier using a local oscillator to make the signal intelligible - the frequency of the local oscillator is controlled by the aforementioned pot. It takes a bit of practise to get SSB tuned in correctly. Try Googling for SSB and you should find plenty of inforation on how it works. Amateurs use lower sideband below 10 MHz and upper sideband above 10 MHz. Military transmissions use upper sideband exclusively.

From: ppasteur
Topic: 284 Message: 284

I notice a significant difference in the audio level between AM and SSB on my KA1103. I do have to remember to turn the volume down when switching to AM from SSB, no doubt!

This is a pain, but not a deal killer for me. I can use SSB just fine, and hear most of the same signals that I get on my Drake R8B, with a 70 foot trapped sloper connected to it.

It sounds like the audio level difference may be typical of this radio...

Anyone else ???

Please!
On the other hand, if SSB does not work at all, it would seem to me that, a person would do well to replace it under warranty if at all possible!!

I don't get any noticeable difference between the AM and SSB audio
levels on mine, I keep it on the same volume setting.

Topic: 288 Message: 288

Hallo all, I found an interesting little circuit that can be added to our radio and decodes Rds signals. With this I believe degen becomes the best bargain of the world. The items costs about 35 Usd mounted, or 25 if coosing the do your-self option. Cause of my absolute ignoranze in electronics I went via the most expensive way, but don't regret. I had to solder only two cables cable for an external battery and dropped a jack in the outline of the 1003 and could immediatlet read names of station, telephone numbers and others info shared from RDs broadcasting om the aditional screen pof the gitzmo. Nice thing. Ill' try to upload some files about and may be some more experts can build it by themselves. Anyway I have no relation wit the peoples sellig it. Just to share my experience. And yes this things, may be tw and a half inches for less thn one, comes without any box so you must built it by yoursel: this my next duty.

You would have to hear quite clerly the voice. On 1103 is not so easy, before you must tune the signal and then move slowly the fine tuning (or better the BFO knob) to center exactly the signal. If you can't you must again the tuning knob of a step up or down and then move again the fine tuning.
The first time is not easy but after some trying you'll learn.

First off, make sure that you are tuned to the correct frequencies. Radio amateurs have voluntary 'band plans' which mean that SSB operation generally takes place on specific frequency ranges. Here is a typical band plan:

http://www.r-clarke.org.uk/ukbandplan.htm

You will see that 7.040 MHz to 7.200 MHz is intended for phone (SSB) and CW (Morse). If you tune between those frequencies with SSB selcted you should hear both SSB and CW signals, if the conditions are good. SSB is unintelligible until it is tuned in correctly - just find something that sounds like garbled speech, tune it for maximum signal and then slowly tune the BFO until it becomes intelligible. It just takes some practise. Quite often, even though two stations are communicating, you will only hear one of them; amateurs often use directional antennas so the station you can't hear is is probably putting out a very weak signal in your direction.

If you hear a whistle with speech or music, you are tuned into an AM broadcast station. They share some bands with radio amateurs.

Topic: 292 Message: 292

You will be able to switch off ferrite bar ant. and use the wip or external.

Put in 21951 khz press am +
Press am fm together and start searching downward to below 100 khz
Once you are below 100 stop the scan and store the freqency then pull it back up from the memory bank and turn off the radio.When you turn the radio on start turning the dial.You will be on the wip.You can check your progress by placing your hand on the ant.I like to go down towards the am stations.By using the wip or external you should be able to hear many more stations.

298. Kaito31 shorting out, or something

Yahoo group: de1103
Date: 2006-04-10 22:14:50 UTC
From: Clyde Benson
Topic: 292 Message: 298

Bon Sera amigi,

The antenna seems to be shorting out or something. Yesterday every time I touched the base unit, it made a scratching noise in the radio.

When I moved the wire I could hear it. One of the batteries also doesn't seem to be seating properly. It keeps popping up at the tit instead of staying in place making a good connection. When I hold it in place with my hand, it seems to do a little better, but not as well as it was doing last week.

Has anyone had any problems with this Active Loop antenner?

Now... when I tune the antenna it doesn't seem to make much difference. It seems to be letting the strongest signal through even when it is turned off. It's a subtle but unmistakable change in how it is operating? I don't get the big signal shifts when I tune it as I did when I first bought it a couple of months ago.

Has anyone experienced anything similar?

ImHotep

Hey Clyde, I have both the KA31 and TG33. They both after time become scratchy and I am afraid QC is to blame. But the cost is low, I guess they are disposable..LOL Maybe some deoxit might help these antennas. Josh

Ok,

I talked with Kaito yesterday morning. They said
the innards are relatively simple. So I wi,, take
it over to the technician tomorrow morning and
see if he can fix it on the spot. It's probably just a loose wire someplace.

The signal really drops off on the radio when I
unplug the antenna, but when I adjust the tuning
think, nothing changes from one end to the other.

It seems to be putting out full power, but it can
no longer precisely tune to certain bands. I
believe that AN-LP1 comes that way. So maybe this is not such a bad thing? :-)

Kaito also said that they would send me a new one
if I shipped the defective one back. So I may
order a new one, and when that arrives, ship the
other one back to them. That way I won't be without a loop antenna.

He only charged me $10.00.00. It is working
perfectly now. Now I can go ahead and order a
second one for my other Sony 2010, or my Degen
1103 which really seems to benefit from using it.
I still want an AN-LP1but I don't know where I
can find a new one. I'm tired of buying used
stuff so when I find a site that has them I will try one of those.

ImHotep,

I took the Kaito31 to my local technician around 1000 this morning. Joe took one look at what it was doing and then took it to the back along with the radio. He took it apart and noticed some wires that needed resoldering. He had it all finished and working perfectly for me in less than 30 minutes.

He only charged me $10.00.00. It is working perfectly now. Now I can go ahead and order a second one for my other Sony 2010, or my Degen 1103 which really seems to benefit from using it. I still want an AN-LP1but I don't know where I can find a new one. I'm tired of buying used stuff so when I find a site that has them I will try one of those.

Yes,

They ran out of stock about a month ago, and
don't have any plans to receive any more.

I can see buying one of those for a $100.00 or
so, but I can't see forking out three or four
hundred dollars for a Wellbrook, or an AN-L380
just to pull in Deutsche Welle a little better.

I use Primetime Shortwave as my main site for
frequency and station locating. I'm sure those
people have the big table top radios and the
outdoor antennas, but I can already receive about
80 to 90% of the stations on their list whenever
they are supposed to be broadcasting to North America.

The only stations I would like to receive here in
Southeast Missouri that I don't are KNLS Alaska,
Voice of Korea, the Philippines, and Guam.

Do any of you all receive those stations with any equipment?

Peace

309. DE1103 Travel

Yahoo group: de1103
Date: 2006-04-14 21:06:22 UTC
From: pjcollradio
Topic: 309 Message: 309

Greetings, Have had a couple of instances while traveling that I found that my 1103's batterys have discharged due to the on/off switch being switched on through the soft carrying bag. Found the perfect solution in the Pelican 1060 Micro Case. The radio fits perfectly and I feel that the 1103 is very well protected. Great little radio isn't it.
P.J.

Locking the controls with Hold should help prevent the radio getting
switched on accidentally. I use it to stop the cat switching it on.

```
I can receive those with any combination of radio/antenna here in
San Jose. Of course they come in better on my NRD525 or RX320 with a
65ft random wire than they do on my 1103 with the whip but I can
still pull them in on a portable...
```

Hey Jim that's great. I guess it is because you are about 3500
kilometers closer to them than I am.

Do you also receive the European stations like Radio France Intl,
Deutsche Welle, Radio Tirana, Bulgaria, and Croatia? I get those
pretty good most nights. How about Channel Africa?

You mean BOTH the on/off and "hold" managed to engage? Wow, that's
quite a feat, as de-activating the "hold" function has a delay on my 1103.

Greetings again, Thanks for pointing out the "Hold" feature. I'd read the operating manual at least twice and somehow that feature wasn't saved to memory. I guess that I need to look over the manual again and see if there are other functions of which I need to be aware. P.J.

Topic: 309 Message: 319

Imhotep,

How about pressing any number; than press the
on/off button. That will cause the radio to play
for that amount of time and then shut off automatically.
I hit up on that one by accident. :-)
Getting the night light to work properly is interesting also.

A lot of the time when I would turn it on nothing
seemed to happen after it went off the first
time. I finally figured out that at night time
what you do is turn it on, and it comes on, or
stays on every time you change frequencies, or press a button.

The book definitely needs to be read carefully if
you don't want to waste a lot of time playing the
"3 monkey game with the radio."

Peace

From: harle83
Topic: 322 Message: 322

I recently complained that my 1103 was noticeably quietier on SSB than my new e5. However when I plug it in, it comes roaring to life. I have to turn it down it's so loud. Why is this? Has anyone else noticed this on their radio's? Am I insane or is it something to do with grounding or more power? It's only a 6volt 300mA Supply. Let me know, this is really weird.
Harry

No, on both counts, and I apologize if that's the way it read.

My point was, once the HOLD function is engaged, as you know it takes a concerted time push to disengage it. And for both the power and hold functions to cause the receiver to turn ON during rough transit would be, well, a feat.

Sure, that delay is there on purpose, so that the radio cannot be
turned on accidently.

> And for both the power and
> hold functions to cause the receiver to turn ON during rough transit

You don't have to press both keys at the same time. Just press HOLD a
couple of seconds and then press ON. I use the HOLD function every
time I turn the radio off.

Have you checked the voltage output of the adapter under load when it is driving the radio? It sounds a bit like there are a few volts more, possibly, than the stated output. This can increase volume in my experience, but it might also shorten the life of components...or it could be a ground effect issue, by placing your hand "near" the extended antenna while on batteries and noting an increase in sensitivity may indicate the power supply is providing an induced ground when it is later being used... any thoughts from others out there?? good luck, ken

Are you getting louder signals, or just more noise?

An adapter can add considerable noise, carried through from the house wiring.

Most wall-warts are unregulated supplies and it could be putting more than 6v into the radio, although determining just how much will require lashing something together so you can get a meter between the supply and the radio's DC input.

I only use rechargeables in my set and never connect it to a supply.

Lately AFRTS on 6350 has been coming in well at night here on the West Coast, so for those curious about their set's SSB performance, that may provide a reliable signal to check by. The next best source of long-duration SSB sigs are the rag-chewers on 80M.

So if I plug in, say a big fm yagi, to the antenna plug on that radio, it disconnects the existing whip? That is cool.

But would the 1103 make use of the yagi?

So if I plug in, say a big fm yagi, to the antenna plug on that radio, it disconnects the existing whip? That is cool.

But would the 1103 make use of the yagi?

Interesting project. Have you uploaded any more info on it?

For others, the direct link to the RDS Decoder board is
http://www.micromed.it/cgi-newstore/commerce.cgi?pid=52 . Everything
is in Italian.

Is anyone aware of any similar kit or pre-assembled adapter available
in North America with instructions in English?

Wikipedia has links to a number of projects for RDS decoders using
microcontrollers or PC's at
http://en.wikipedia.org/wiki/Radio_Data_System .

kitkatjt -

I am assuming you're the member that posted this and I wanted to tell you that I appreciate this information as I just received my Degen 1103 today. I also have the newer Kaito 1102, so one of my main reasons for purchasing the 1103 was to received 160 meters. I tuned in 1.947 this evening in SSB mode and the hams are loud and clear. Works like a charm.

no, I'll try to find some english test and upload later with the pictures of the decoder in the new case I builded. I can add some more info: I just soldered the tree cables as per instruction, added a 9 volts cell, and the thingy immediately started working. I tested it with three radio: my de 1103, 1102 and sony 7600D. The 1103 is far the more responsive, I simply had to put the jack in the out-line hole and the name of station comed up immediatly(here in Italy is crowded but it did not miss any boadcast). with the 1102 (no line out, only earsbud hole) I had to play a little with the volume before seeing the info on the display, the sony is in the middle adn the gitzmo reads better in the earbud pin than in the out line. The bad with 1102 and sony is that radio become mute when scanning while with 1103 you can continue listening and reading too. For me it was worth the costs.
later for pics

I am glad you like it and it does work like a charm. AM off the
antenna is alot better for me.

348. DE1103 SSB distorsion

Yahoo group: de1103
Date: 2006-05-03 09:53:12 UTC
From: paolonan2000
Topic: 348 Message: 348

Hi everybody,
I recently bought a DE1103 and at beginning was really happy of this little radio, especially for its capability to receive in SSB mode.
Unfortunately in the last few days I've found that the SSB audio is strongly distorted, especially on strong signals.
Sounds like a sort of instability of the BFO signal.
If I turn SSB on with an unmodulated carrier, the result is not a fixed clean tone but something like a chirp.
Has anyone experienced a problem like mine?
Any suggestion to fix it?
I've seen the "russian" screening mod, but he mentions that he found a distorsion due to his hand position on the radio, instead my problem is always present.

Thanks
Paolo

Yes, I forgot to mention that that also was a nice side event of that
feature. Down in my basement coupled to an outside antenna I don't
have to turn the unit to pick up a weak AM station.

I've experienced a little bit of that, especially on very strong signals in the 20 meter band, but switching to "local" seemed to eliminate it.

I wasn't talking about the IF filters. Local/dx switch is an
attenuator. Sometimes attenuating a strong SSB signal will make it
much more readable...

Hi Steve, did you get to do these measurements? They would be most interesting.

Another factor that may contribute to perceived differences in distortion levels between MW and SW stations is AGC speed and differences in audio processing and program content. Maybe MW stations process more aggressively and push relatively more bass energy. A fast enough AGC will act on modulation, attempt to chase low frequencies, thus affecting the IF output at audio rates and causing audio distortion.

Sorry Jim, I understood your suggestion, don't know why I mentioned
the filter switch.
However in "local" position the problem was still there.
I say was because yesterday night something happened. Was listening
on 40 meters SSB (distorted) when the audio little by little went
down, until just a little rustle was audible from the speaker.
Now in AM/FM mode everithing is still ok, but no beating at all in
SSB.
I really think that the BFO is death. Need to open and investigate,
hoping I have enough skill to fix it.

Thanks
Paolo

From: Fabrizio
Topic: 348 Message: 356

Yep, the local/DX switch definitely helps with very strong signals. Sometimes the distorsion is also caused by interference from electric devices nearby.

I have noticed, though, that there is SSB distorsion in the 10 meter band - 28 Mhz -, regardless of the local/DX switch, and to a lesser extent, even in the 12 meter band of 24 Mhz.

Has anyone noticed the same, despite the little activity in these bands with the current low sunspots numbers?

Greetings from Rome

Fab

From: Paulo Roberto Gomes Cabral
Topic: 348 Message: 358

Paolo I don't have this problem in my DE1103, neither in strong signals - The only thing I observed was the precision in SSB fine tune, but I did the change between SSB fine tune and Volune control , suggested in modifications by this Russian site and now I have high precision in mode SSB- You can see this in the post I did in the file area of this group - I believe this modifications are fantastic although I did only the alteration of the antenna joint and change in control of loudness and frequency control in regime SSB.

Paulo Cabral - Vila Velha - Espírito Santo - Brazil

Hi everybody,
I recently bought a DE1103 and at beginning was really happy of this
little radio, especially for its capability to receive in SSB mode.
Unfortunately in the last few days I've found that the SSB audio is
strongly distorted, especially on strong signals.
Sounds like a sort of instability of the BFO signal.
If I turn SSB on with an unmodulated carrier, the result is not a
fixed clean tone but something like a chirp.
Has anyone experienced a problem like mine?
Any suggestion to fix it?
I've seen the "russian" screening mod, but he mentions that he found a
distorsion due to his hand position on the radio, instead my problem
is always present.

Thanks
Paolo

Dear Clyde, I see that your Italian is good, but I'll reply in English so that the other members can follow us...

As far as what stations I hear, well, I guess I am an 'atypical' listener because I mostly listen to hams, radioamateurs, rather than BCL.

I have bought my DE1103 just before Christmas ans so far I have heard hams from 186 DXCC countries out of 335.

Just any part of the world can be received in Rome, at the right time of the day and at the right frequency. I think that Europe is a good place for SW listening.

On the last few days, we had good propagation at about 8 am in the 20 meter band with Hawaii (over the North Pole, always a critical path) and Australia via the long path (signals travelling over central America). Early in the morning the 40 meter band is still open for central-south America and New Zealand.

Then from late morning until mid afternoon we can receive the Far East countries, especially Indonesia, Japan, the Philippines, Thailand and the western Pacific islands, such as Saipan and Palau in the 15 and 17 meters bands. North and Central America is received in 20 meters from early afternoon well into the evening.

During the afternoon it's also possible to receive South African countries, Mauritius, Reunion, Angola, up to the 10 meter band. From mid to late afternoon it's time for South America in 15 and 10 meters.

After 8 or 9 PM Asia comes through in 40 meter with good signals especially from Japan.

As far as broadcast stations are concerned, I haven't really pursued this kind of listening, but I remember I found an American religious station on 5070 Khz that was quite strong during the winter mornings before sunrise.
Since you speak Italian, take a look at http://www.bclnews.it/ for schedules and tips.
Ciao

Fab

Bon jour Fabrizio,

Come tallez you ce matin?

Merci pour les gentile complimenti. Pero, my Italian is only a one or two on a scale of 100. Your English is 100 on a scale of 100.

It really makes me feel small to see how much better educated, and sophisticated most Asians and Europeans are than we Americans. It like comparing someone with a kindergarten education to someone with a PhD.

Yet somehow we feel everyone in the world is inferior to us and are supposed to follow everything we demand, or else we will make them an offer they can't refuse.

I think we are going to be in deep trouble on judgement day.

I did a little shortwaving years ago when I live in Northern Italy at Aviano, but I can't remember what I was hearing. This was back in the 60's and 70's. There was no computer, cable, or satellite back them. The only TV I received was in Yugoslavian, or in Italian. I could listen to AFRTS on my radio, but that was about it. I spent most of my time catching donne at the spiaggia. I like Rimini a lot, and all of the northern adriatic beaches like Lignano, Jesolo, Venice Lido, Caorle, bibione, etc. Now today it would be fun to lay out there and listen to my radios.

Never heard Angold, Reunion, or Mauritius either. You really have
some great listening there. Of course Rome is very close to Africa. I
think by air maybe only 370 miles away.

Listening really sounds great over there. Italy must be perfectly
centered to receive stuff from all directions far off like that.

Au Revoir Amigo mio

I hope to return to Italy this summer, spending a couple months
eating the great food, drinking the fine wines, looking up old
friends, and traveling around from one end to the other. It's really
odd that I spent over seven years there, but I never visited Roma?
:-(Only the aeroporto Ciampolino.

364. re : SSB Distortion

Yahoo group: de1103
Date: 2006-05-07 02:07:26 UTC
From: Dennis Ls M Cruz
Topic: 364 Message: 364

Hi!

Are you using the external power supply/adapter when you get this distortion? Try using batteries. If the distortion goes away, ground the radio every time you use the external power supply. I had the same problem like yours on both my Degen DE1103 & DE1102 when using the power supply - the audio on SSB sounds jittery. I solved it by connecting an alligator clip to the aluminum window screen nearby. I have a Sangean ATS-505 & the Sony ICF-7600GR and they sound ok on SSB using AC/DC adapter without any grounding. I listen to SSB a lot (Aeronautical HF & HAM)

Greetings from the Philippines

Dennis Ls. M. Cruz - DV7-BKO

Hi Dennis,
the SSB function of my DE1103 is death, now. It means that my
problems were due to some defective component or soldered junction.
I have to investigate and fix the fault, if possible.
Thanks and 73.

Paolo (from Italy).

Dear Clyde, hey don't start with French now! My French is very poor :)

I have read this message of yours with interest and I have also been amused by it :)
Maybe we should continue by private emails from now on, but this time I will reply here because the main subject is still radio reception after all.

> It really makes me feel small to see how much better educated,

We could write a book about that. There would be many things to say.... And then, I don't know the American society well enough to have a clear opinion...

> Davvero! I haven't really gotten into ham listening yet. It is boring
> to me most of the time.

I understand that it can be boring if it's only like:'You are 5/9. What's my report?'-'You're also 59, 73 and good luck'. But I like to search for rare countries and you never know what you're going to listen. It's also possible to listen to longer conversions where the two hams are not only exchanging reception reports, but they discuss several topics. For me it's a good opportunity to practice English. It's nice to listen to an Aussie in Queensland telling a guy in the UK that he just came home from work, had a cold beer and is watching the ocean from his window as he speaks...

> Goodgoobaloobee! I didn't know there were that many countries in the
> world. I thought there was only the United Sates and Northern Europe?

Hams are all over the world and there are more DXCC countries than nations. For example, mainland US, Puerto Rico, US Virgin Island, Hawaii, Alaska are all different DXCC countries and so are mainland Italy and Sardinia. The list is at
http://www.arrl.org/awards/dxcc/dxcclist.txt

> I spent most of

I don't blame you for catching donne, rather that spending time with
radio! I am sure you would be amazed to see how those places have
changed in 30-40 years, I guess... Well I am 42 y.o. by the way.

It's much easier to receive hams from those countries instead of
broadcasting stations! That's why! Yes, distance matters, but not too
much. South Africa is the farthest, yet it comes through loud.

Actually, it's pretty easy to get an Hawaiian signal here
in Missouri. Just listen to WWV. When you hear the female voice
giving the time, that's WWVH in Hawaii.

Now, this may well not be *what* you want to hear from Hawaii,
but you can log it and count the state that way...

:-) Regards & 73, Will (St. Louis, MO)

Hi Omar,

I'm an FM Dxer, and so for me, the RDS codes (especially the PI code) is very important. For example when receive a 2000km distant station via Sporadic-E, you have almost no chance to identify it, unless you can read the PI code of the station.

And additionally, RDS provides lots of interesting data, for example with the list of alternative frequencies, you can say, which FM transmitter was received, if you have got the same program either on the same frequency, or just in 100kHz distance.

So, for an FM DXer, RDS is much more than just the eight characters of the station name.

Ciao
Christoph

> she usually calling out the time?

It's on 24 hours a day, same as WWV in Ft. Collins.
You can often hear the WWVH female voice giving the
time just before the male voice on WWV announces it.
Try the usual 5, 10, 15 MHz WWV frequencies and, if
propagation is favorable, you may hear her just about
any time. (You get both WWV & WWVH coming in over each
other but since their frequencies are so precise and
stable, there's no ill effect.)

73, Will

371. DE1103 modifications

Yahoo group: de1103
Date: 2006-05-12 10:19:14 UTC
From: Jara
Topic: 371 Message: 371

Hi all,

if you speak russian, see:
http://lab.radioscanner.ru/review/degen2.php

Many interesting modifications here!

Regards, Jara "Rat"

372. Trick Tune below 76MHz ???

373. DE1103 mods on russian site.

Yahoo group: de1103
Date: 2006-05-12 14:14:37 UTC
From: g0wqi
Topic: 373 Message: 373

Hi all
I tried some of the mods on my 1103, but decided not to swap the bfo and volume controls. Some may like to do this mod but I don't mind the controls as they are.
The first mod was to alter the long external aerial input so that the pre amp for the whip aerial is not used and is not overloded. It seems to work fine.
The second mod was to alter the low pass input filter to improve sensitivity between 14 and 30 MHz. This worked very well.
The third mod was to improve the internal screening. A definate improvement.
Note I am an electronics professional so please don't destroy your radio trying these mods if you are not experienced.
If you want to see for yourself use babel fish to translate the article but be carefull as the translation is very odd !!!

Unmodified the 1103 is really very good if you can live with the unusual display and volume control I'd recomend it. To be honest I woudn't worry about the display the radio works so well you can live with it.
Have fun
John

374. Re: [de1103] Trick Tune below 76MHz ???

Topic: 372 Message: 374

I've never heard about Tunning below 76 and up 108Mhz , but up 30 MHz I did using the instructions below from the Russian site :
http://lab.radioscanner.ru/review/degen2.php

For the "disclosure" above 30 MHz make the following:

1. You will include receiver and nastroyte it for the frequency of 21951 kHz via straight collection on the digital keyboard (2-1-9-5-1- "BAND+").
2. press simultaneously two buttons: "BAND -" and "BAND+" to the moment of the beginning of scanning downward in the frequency.
3. you will stop scanning by pushing of any knob, then press button "BAND+" and retain it prior to the beginning of scanning upward in the frequency.
4. wait for reaching frequency above 29950 kHz and you will stop scanning. Write down the frequency of stoppage into any storage cell.
5. cause recorded storage cell by button "M/F" and pass into the regime of manual tuning by repeated pushing of this knob. On the display there will be frequency recorded earlier, and inscription "MEM" in the right side of the display will be replaced on "VOL".
6. you will neglect scanning upward in the frequency by pressure and by the retention of button "BAND+". Scanning will pass boundary 30 MHz (indications on the display will take the form of the type "b0000", where the first symbol - inverted letter B). Attention: it is necessary to have time to stop scanning at the indications of the display between "b000y" and "b0009" (30.001-30.009 MHz).

377. Locking up after changing batteries

Yahoo group: de1103
Date: 2006-05-15 07:59:19 UTC
From: leon_heller
Topic: 377 Message: 377

I always run my DE1103 off batteries charged in a rapid charger. I changed the batteries yesterday and the radio 'locked up' with the display light on. I had the Hold setting activated before changing the batteries, and couldn't deactivate it. Resetting the radio restored everything to normal, and I still had the memory contents intact; I did have to reset the clock, which had been zeroed, and the volume setting which was at maximum.

It hasn't happened before; I think it might be something to do with Hold being on when I changed the batteries. Has anyone else experienced it?

Leon

Hi Josh & everyone,

I only bought 1 radio during my visit to Hong Kong last month - the Tecsun BCL-3000 but manage to get a no brand analog multiband radio in the trash bin (along with 4 Computer units - complete with RAM, CPU & motherboard, AGP Video cards, DVD & CD-Writer drives - Hong Kong & Singapore are the best place to dig the trash bin for discarded electronics, hehe!). I couldn't buy some more (like the Tecsu R-308, Tecsun 1959 radio, etc.) because I will have a hard time explaining & justifying it to my wife since I have enough radios here at home to last me a lifetime of listening!

But Dang ! That Redsun radio should have been released earlier and save me from getting the BCL-3000 as I prefer the looks & features of that radio. However if it doesn't do SSB then I'll pass that model till they get one that does SSB of the size of the BCL-3000. I've been looking for a big but affordable digital multiband radio that can do SSB. Right now the only choice I see in the internet that I can afford is the Sangean ATS-818 but it is not available in HK or Singapore.

Anyways I'm off to another trip to United States next month and had already asked my Credit Card (more like loan shark, hehe...) company for an increase in Credit Limit.

Redsun or Tecsun should build a nice & affordable SSB capable receiver
the size of the Sangean ATS-818 or possibly the size of the GE SRIII ;-)

yup.....every time I change the batteries!

Is that with Hold on and off? I thought that might be relevant because I think I had it off when I changed the batteries previously, and didn't have any problems.

Is this happening if you change the batteries
with the external power supply plugged into the radio?

Or only if you have the radio completely unpowered
while the batteries are out?

If the latter, I'd think that the lockup could be
avoided by attaching the external power during the
battery change.

The radio wasn't powered from the external supply. It would probably be OK
if it was.

Good day,

Me - personally - am waiting for the Degen 1104, which certainly will have SSB,
and will most probably be an improvement of the DE1103, also in design.

There is a link to a picture of the DE1104,
hope they release it soon....

From
http://www.radiointel.com/oldnews.htm
I don't see "SSB" mentioned. Perhaps someone has
definite information about SSB for the 1104?
There are links to a picture of the 1104 there also.

<paste>
More Info On The Degen DE1104
Jonathan Lee passes along this info on the DE1104. The DE1104 will
offer the following features:
1. BAND SETTING: FM (3 bands), MW, SW (11 bands) = 15 bands total
2. FM: PLL, manual tuning (50K/step), auto tuning (SCAN and ATS all
100K/step), 3 group memories (12 memories per group) = 36 memories.
3. AM (MW and SW): traditional manual analog, 4 gang filter turning.
Frequency numeric digital display.
4. SW dual conversion receiver
5. SW (11 bands), select band with a key-press
6. FM frequency range: 76-108 MHZ
7. SW frequency: 3.200-21.85 MHZ
8. MW frequency: 520-1710 KHz
9. Tone Control - News/Music switch
10. Super Bass switch
11. Stereo/Mono switch
12. Back Light switch
13. Sleep Timer setting
14. Dual Clock Display (local and UTC)
15. Week Display
16. Double alarm clock and can be made day specific during the week.
17. Signal Strength display
18. DX/Local switch
19. Keypad locking
20. Volume control numeric display
21. Internal Battery Charger
22. Size: same as DE1103:165X105X29(mm)
23. Battery: 4 AA batteries
24. Speaker: 77 mm diameter
25. Battery Strength Display
26. At Turn Off: Display dual clocks, battery strength, week display
27. Ant Input Jack
28. Meter Band Display
29. 6V AC adapter

Other Special Notes about the DE1104:
1. DE1104 is unique with a lot of functions - analog and digital (PLL).
2. Performance claimed to be the same as DE1103 but with a lower price

than the, DE1102, DE1103, DE1105, and only more expensive than DE1107.
Hence it has a high cost/performance ratio.
3. DE1104 will go to market the same time as it does in the U.S. The
U.S. version will have additional Air Band and Weather band function
and will not sell on the China market. From now on new Degen radios
will go to U.S. market at same time as in China.
4. Development of the DE1104 is complete and will go into production
at this time.

Not many people are interested in SSB receptions in the first place and tuning a SSB station is tricky. More importantly most people are likely blamed the radio's performance rather than themselves when encountered a SSB station. May be this is the reason why the designer (s) deleted the SSB function intensionally for this "Universal" model (not as a HAM's receiver !)to avoid endless complaints to come.

Adding a large capacitor (perhaps a supercap) across the battery connector
should fix the problem.

401. Tuning Knob Problem

Yahoo group: de1103
Date: 2006-05-22 03:31:26 UTC
From: mushlee
Topic: 401 Message: 401

I had a problem with the tuning knob- it stopped working. I woke up one morning and tried to turn the volume down and nothing happened when I turned the tuning knob and no pushing or pulling would solve the problem, and the lock wasn't on. So I got a little frustrated and decided to open it up myself as I didn't want to go through the trouble of sending it in to be fixed. I essentially moved some wires around and it started working again and still is. I moved the wires that were set into the blob of translucent material; I pulled them down away from the bar running along the top internal. I'm not exactly sure what I did but I am happy that the radio is working again. Has anyone else dealt with a non-functioning tuning knob? It's a great little radio but this problem has me questioning the quality of workmanship, wondering what could go next. And I sure would like to know what I did so I could do it again if needed. Sorry for the lack of terminology when referring to the radio's internals...

The translucent stuff sounds like hot melt glue. It's often used to secure
wires in low-cost rquipment.

I bought my DE1103 just before last Xmas. It seems fine on that, but I don't know if it is an ALPS unit in it. I've actually got some ALPS encoders, but haven't checked to see if they are the same as the one in the radio. Perhaps it's only the Kaito radios that have the problem.

It's initially only for FM and Shortwave, but if you employ that five digit-coded keyboard entry process mentioned in other posts in this forum you can obtain use of the external antenna input for the AM band. A nice undocumented feature of the 1103, for whichever model you have.

> have.

Hi!

I have A015058 ... it is new or old version?
I bought it in Moscow, because Degen is not in Europe.
(price cca 116USD)

1/ one problem: I cannot set frequency up 30MHz: procedure from
russian web is good, but step is 5kHz and I cannot stopped it at b0005
... and next step is out from band.

2/ second problem: do you know who tested Degen with RDSdecoder, for
instance RDSdecoder by Conrad? Can I use for instance line output or I
need special output from FM demodulator for RDS?
(I know that RDSdecoder by Conrad work for instance with ATS803A also
from earphone output... and also without connection if you lay decoder
at speaker box from other FM receiver)

3/ a question: do you know input impedancy of external antenna
connector? I think that it is Hi-Z input.
Interesting test: I use other LC circuit (feritte antenna) for 77kHz
time station in Europe and connect it direct to external antenna
input:
and LC circuit work good, and tuning (new feritte antenna) work also
good.

4/ receiving below 100kHz: I had problems with strong signals from MW
band - I use a simple PI circuit with two capacitors 470pF and 3.3mH
inductor to exet. antenna input. You must use also GROUND , not only
antenna! Now I have not problems with signals from MW band and band
below 100kHz is clear.

Regards, Jara Rat

413. Defective new Kaito KA1103

Yahoo group: de1103
Date: 2006-05-28 23:51:05 UTC
From: rcarp5
Topic: 413 Message: 413

I just received my new Kaito KA1103 and it quit working on all bands with the exception of the FM band. I was comparing it to my Kaito 1102 which I have had for a couple of years now and really like. I like the look and feel of the 1103 and the analog tuning capability. I was copying some 40 meter SSB when the radio just quit receiving on the MW and all SW bands. I still have background noise but absolutely no signals. I removed the batteries and also did a reset but to no avail. In the brief time I was able to compare the two radios the 1103 did seem to have the edge on sensitivty. I guess it will go back to Universal Radio for an exchange. I was wondering if anyone else has had this type of problem with 1103. I see that it is a dual conversion receiver and I wonder if it is dual conversion on the FM band or just the MW and SW bands. Thanks

415. DE1103 and preselector

Yahoo group: de1103
Date: 2006-05-29 22:21:32 UTC
From: Jara
Topic: 415 Message: 415

Hi all,
I tested my DE1103 with my homemade preselector and all work very good! (But you must set OFF feritte antenna for LW and MW band!)
Schematics is here (sorry text only in czech language, and you can use other dual gate fet, for instance BF910, BF964 and other...):

http://krysatec-labs.benghi.org/phprs/view.php?cisloclanku=2004092415

and notice: use zener diode 4V7 or 5V1 paralell with RF gain variable resistor! (she is not in schematics...)

regards, Jara "Rat"

I send you my tests new DE1103 and old DX394

and my test:

DE1103 DX394 DX394+ my
AM synchrodemodulator/SSB mixer
with TDA2541

184kHz 2 2 3
408kHz 3 0 1
874kHz 3 3 4
3714kHz 3 2 2
4583kHz 2 0 1
6005kHz 2 3 4
7130kHz 2-3 2 2-3
9545kHz 2 2 3
11700kHz 2 1 2
15100kHz 3 2 3
17490kHz 2 3 4
21610kHz 2 3 4
23620kHz 2 3 3
26602kHz 3 2 3
CB band 3 2 2-3

overall quality ... 0 = no signal

Tested with signal from the same antenna and my homemade active preselector
DE1103 : feritte antenna OFF
DX394: feritte antenna shielded

Immunity: The same for LW and MW band, for SW bands DX394 has better immunity.

From: Carlo
Topic: 418 Message: 418

Hi guys from Italy, this is a nice group.

I got a problem :

my 2 Degen 1103 not receiving sw bands, one after recharging batteries
and the other just pulled off from the box ,

but Fm bands working good in both radios.

First to resend to Mr Liypn can i solve the problem?

It's a FET problem?

Thank for the help but i'm so disappointed.

Bye from Carlo.

Someone else had a similar problem a few days ago. Have you tried resetting
them - the little hole between the Power and Hold buttons? Perhaps Degen's
quality control is deteriorating.

Thanks for your replay Leon:
yes i have reset it many times, but nothing change.
I use this method: batteries inserted, hold Power + hold buttons +
reset point at the same time it's correct?
Can you explain me the right reset?

Bye and thanks again.

When I had a problem after changing the batteries I just pressed Reset. I think the radio was turned off at the time. The memories were left intact but the clock was reset.

It does sound as if the radios are faulty and need to be returned. Of course, the problems might be due to simple faults like poor solder joints that could be easily fixed.

Leon

Do the radios work on Medium Wave and Long Wave?
Liypn once told me he tests all radios before shipping. Assuming
that is still true your radios worked properly when shipped.
Perhaps the radios were dropped during shipping and something
has come loose. Leon suggests if that is the case it would
be an easy fix.

425. IF filters 10.7MHz

Yahoo group: de1103
Date: 2006-06-04 07:41:39 UTC
From: Jara
Topic: 425 Message: 425

Hi all,

I want change IF filters 10.7MHz - I need not "hi-fi" stereo but I need better selectivity. Do you know anybody who tested it and do you have any photos and good advices for me?

Did you tested also signal from pin 19 of TA2057 for external RDS decoder?

Idea: I think that we can use connector "line out" for mono FM and AM audio out and also for output for RDS decoder...

Many thanks for help!

Best regards, Jara "Rat"

PS.: I heard yesterday many stations from Turkey with only telescope antenna! (E sporadic layer...)

Sorry, I speak english a little, I learnt english 25y ago.

Hi Jara,

there is a very active - however German speaking - forum at:

http://www.ukwtv.de/foren/index.html

Do a search for "Etón E5 Testbericht" and you will find a thread from DX-Timo (Date:23.04.2006) with a description (and nice pictures) how to change FM-filters in the E5.
The DE1103 has (almost) the same pcb-layout as the E5, but it is even a little more difficult to desolder one of the filters as there are two additional SMD-devices directly connected to it!

Good luck!
Uwe

PS: In another thread they are going to make an omnibus order for small FM-IF-filters (110/83/56 kHz). Perhaps you can join in there! Search for: "Neue Sammelbestellung ZF-Filter".

428. Hot Wall Wart and ECSS tuning

Yahoo group: de1103
Date: 2006-06-04 20:10:29 UTC
From: Pete Nalda
Topic: 428 Message: 428

Hi,
My wall wart seems to be pretty hot when charging. Is this normal or do our radios have exploding wallwarts?

Also wondered if anyone has had success with using sideband to tune ECSS (sort of what can be done if one hasn't synchronous detection. I did try it with Radio Habana but I don't know that I got it stable enough to work.

1. "Very Hot" wall wart during charge is definately not normal and can be dangerous. Unplug it Immediately ! The causes can be:
a. Bad batteries (shorted)
b. The wall wart output voltage is too high (much greater than 9 Volts !)
c. The wall wart's output polarity is reversed.
d. It has internal short(s)
Suggest substituding a new set of "Good" batteries as well as a "Good/correct polarity" new wall wart to confirm if this is the case.

2. DE1103 do not have any computer interface built-in. No doubt you can implant an external interfacing device to do the ECSS tuning. But may not worth the costs and troubles.
Hope it helps.

As an afterthought did u use "Rechargeable batteries" ? (Not ordinary
Alkali batteries) Again if this is the case use the correct typies
as mentioned in the user manual.

From: dlambfra
Topic: 413 Message: 432

I've had exactly the same symptoms with a DE1103. The only solution is to remove all batteries and power for 48 hours, so that the radio is drained of all residual power and resets properly. Mine worked again afterwards, but has just gone belly-up again, so I'm in for another 48-hour 'downtime'. It'd be nice to find a way to accelerate this process or find a permanent fix, or even better for Degen/Kaito to address this bug so that it doesn't happen in the first place!

Topic: 418 Message: 433

Hi Carlo,

I just bought a Degen DE1103 from Mr Liypn too, and unfortunately I've encountered exactly the same problem as you.

I received the radio, unpacked it and started playing around with it, and was pleasantly surprised by the number of stations it picked up. Unfortunately, three minutes later, something switched and I could no longer pick up anything on any band aside from FM. When I told Liypn about it, he suggested removing the batteries and any power supply and leaving the radio like this for 24 hours, then trying again, after having pressed the 'reset' button. I did this twice, no luck. I then left the radio a full 48 hours, and it worked again.

So basically (I guess) you have to drain the radio of any residual charge so that a real reset does take place, and this can take up to 48 hours - not very convenient, to say the least. Unfortunately, having got it working again, I then started using it again yesterday, only for the same thing to happen again after 15 minutes. So I'm now half-way through a second 48-hour waiting period, so that the radio resets fully again. At the rate of 3 - 15 minutes' before having to wait 48 hours for the radio to work again, the unit certainly won't be worn out very quickly!

Liypn has offered to replace the radio, and of course I can't blame him for the fault (although if this becomes a regular posting theme then perhaps Degen should look into fixing this bug), but that involves me paying all postage :-(

So if anyone has any ideas for solving this problem, or even for accelerating the 'full discharge' method that makes the radio reset properly, I'd be all ears!

Thanks
Duncan

Hmm.. Not sure if it's very hot or not, as it seems no hotter than my laptop's power brick when it's been charging. Yesterday was it's first charge too. I'm camping so I've not had a chance to give it a long charge yet to see how it is.

I take the batteries out and charge them in a standard charger. You probably need to charge them for longer.

according to the manual a full charge from zero takes
13 hours (or was it fourteen?). Other people suggested
to rather use an external charger because the in-built
is too rudimentary.

http://www.knls.org/English/trascripts/dxdef04.htm#Zero

Zero Beat Tuning

Zero Beat tuning, also called ECSS tuning, is a method used by Dxers to increase the readability of a poor AM signal. It requires the use of the receiver's single sideband mode or beat frequency oscillator, also called the BFO. It's the same as tuning in an AM station like it was a single sideband transmission. Some Dxers prefer using the Sideband mode or the BFO while tuning across a band. Each station creates a tone sweeping from one end of the scale to the other as the receiver tunes by, even on stations too weak to produce audio. Zero beat tuning is accomplished by carefully tuning in on the center of a station so that the tone goes down in scale, stopping just at the point where the tone disappears. This point is called the zero beat. At this point the station's audio will become intelligible once again. In some cases this tuning method will improve the readability of the station. In sideband most receivers are using their most narrow bandwidth filters for increased selectivity. Fading and flutter is reduced because the receiver is placing its own steady carrier wave over that of the station. And the heterodyne note produced by a pair of stations too close together can be eliminated by properly zero beating on the desired station. Zero beating also allows measurement of the station's frequency with the greatest accuracy because the zero beat is on the exact center frequency of the station. On the minus side, music cannot be enjoyed in its full range this way.

In other words, there is no requirement for any computer interface to use ECSS! People have been using the technique for many years before any radio had a computer interface built in to it.

Having said that, I have not had a great deal of success using the SSB mode on my 1103 for ECSS tuning. I believe that it actually tunes *both* sidebands anytime it is in SSB mode. This may be part of the problem, because you cannot select the specific sideband, and the filter does not change, the advantage of being able to use the features to tune away from adjacent channel interference is limited. Besides this I have not found the BFO to be easy to adjust, period. Many times I have given up on listening to SSB ham conversations because there was not enough time during each transmission to get the radio adjusted to hear both sides of the conversation.

Another thing that I noticed when trying to listen to AM stations with ECSS is that the volume is much lower when SSB is selected. When the finicky BFO control and the loss of audio level are taken together, I always end up just leaving the radio set for AM listening (SSB off) when tuning to an AM

station.

Phil

Also wondered if anyone has had success with using sideband to tune ECSS (sort of what can be done if one hasn't synchronous detection. I did try it with Radio Habana but I don't know that I got it stable enough to work.

It used to be called 'exalted carrier detection' when I first came across it 40 years ago, I just checked and that is what the EC stands for. Synchronous detection as used on the Sony radios is similar, but easier to use.

441. Defective Degen DE1103 & Kaito's (& temporary fix)

Yahoo group: de1103
Date: 2006-06-06 06:02:48 UTC
From: Duncan Lamb
Topic: 441 Message: 441

I just bought a Degen DE1103 from Mr Liypn (and just joined this group - hello! I'm based in France...). Like a couple of other people on this list I've encountered a problem with it.

I received the radio, unpacked it and started playing around with it, and was pleasantly surprised by the number of stations it picked up (being new to SW radios).
Unfortunately, three minutes later, something switched and I could no longer pick up anything on any band aside from FM. When I told Liypn about it, he suggested removing the batteries and any power supply and leaving the radio like this for 24 hours, then trying again, after having pressed the 'reset' button. I did this twice, no luck. I then left the radio a full 48 hours, and it worked again.

So basically (I guess) you have to drain the radio of any residual charge so that a real reset does take place, and this can take up to 48 hours - not very convenient, to say the least. Unfortunately, having got it working again, I then started using it again yesterday, only for the same thing to happen again after 15 minutes. So I'm now half-way through a second 48-hour 'downtime', so that the radio resets fully again. At the rate of 3 - 15 minutes' use before having to wait 48 hours for the radio to work again, the unit certainly won't be worn out very quickly!

Liypn has offered to replace the radio, and of course I can't blame him for the fault (although if this becomes a regular posting theme then perhaps Degen should look into fixing this bug), but that involves me paying all postage :-(

So if anyone has any ideas for solving this problem, or even for accelerating the 'full discharge' method that makes the radio reset properly, I'd be all ears!

Thanks
Duncan

In my DEGEN DE-1103 I do the same and I have no problem to receive these frequencies - no problem 000khz to 29999khz , SSB or AM - Any frequency I want only punch in the frequency or using the memory of the trick code - With the trick code 000khz to almost 35000khz - With the trick code the counter goes 39999khz , but the signals only util 35000khz

Am I missing something? You don't need to "trick" it, Punch in 18068
then BAND+. There you go. Hit SSB if needed, bring to a boil,
etc,etc...

Yeah you just have to manually punch in the numbers! This radio is continual
from 000 to 30mhz. with the easter egg!

Has anyone been able for program or force the 1103 into receiving the amateur band (18068 to 18168mhz) using that trick code? I accomplished setting my DEGEN 1103 to get into the 160 meter band (SSB), but even starting at 000 and thumb turning the tuner it seems to bi-pass that 17 meter band.

Just key in 18068 directly using the numeric keys. You could put it in one of the memories.

Leon

450. Radio won't turn on

Yahoo group: de1103
Date: 2006-06-08 18:41:49 UTC
From: Mike
Topic: 450 Message: 450

Purchased a de1103 a few weeks back via ebay. Radio worked great, until this morning when I went to turn it on. It would not turn on, the clock was fine, but couldn't get the radio part to power on, no backlight either. It acted as if none of the buttons on the front worked (i.e. if I pushed the "vol" button I wouldn't get the state of the battery charge). After playing with it for several minutes it came on, but couldn't be tuned, or the volume adjusted, or even turned off. When I removed the power again, and reconnected it was dead again. Removed the batteries and put them back in. No luck. Removed the batteries and put it on the AC Adapter/Charger, clock came on but no radio. Hit the "reset" button, which reset the clock but still no radio. Right now I'm in the process of leaving it w/o batteries and w/o power for 48 hours and will see what happens on the other side. Any hope for this one, or is it as I fear now a clock that I can't even set :-(?

-Mike

Hi Mike

Did you tested also reset button?
Can you set clock?
Can you tested connect + and -pol without batteries for a few minutes?
(It work good with ATS803A...)

For instance: one my Degen work good but I cannot change volume!
After I set clock, volume work good...

From: Jara
Topic: 452 Message: 452

Hi all,

I use Degen with external RDS decoder now. My new connector is female jack 3.5mm near connector for external 6V input. (sorry, I have not photo now) I use shielded wire and condenser cca 15nF. Shield you connect near connector to ground and wire via capacitor 15nF to pin 19 of TA2057. I know that will be better remove capacitor 330pF from pin 19 (I think it is number C 209) but I have not courage remove also all PCB with feritte antenna because my eyes are not good...
Sorry, I learnt english 25y ago..

Regards!
Jara Rat

RDS decoder is with simple preamplifier (with one transistor) and TDA7330 and software is from www.esslinger.de

The reset button does work because when I press it the clock
dissappears and when I release it the clock is set to "0:00".
Unfortunately I am not able to set the clock at this point.
If the 48 hour w/o power and batteries doesn't work I'll try your
suggestion of the connecting the plus and minus tabs on the battery
(w/o batteries or the AC Adapter connected) and see if that works.

Thank you for your suggestion.

I'll try that too - my DE1103 is still in its second huffy phase, and even 48 hours with no power hasn't worked this time. Of course, to find that out I had to insert batteries, thus I have to start another 48-hour period from scratch. Perhaps the 'connecting terminals together' method will accelerate things (can but hope). At this rate, despite the heavy postage costs to China (24 Euros), the radio may soon be going back to Liypn for replacement (but what if the replacement's the same?!!)...

455. Jog dial is out of sync...

Yahoo group: de1103
Date: 2006-06-10 13:30:02 UTC
From: war4prez2002
Topic: 455 Message: 455

For some reason the main dial is out of sync with the steps. Usually when moving down sometimes it actually goes UP...when moving up it isn't nearly as bad. I can still manually put in frequencies but this is getting annoying.....fast!

If I need to open it up and adjust something (i.e. hack it) then that's not a problem as technically this is the degen version so I can't exactly return it anyway...

It is a simple multi-contacts switch. Likely you can open it up and clean/bent those questionable contacts. However like any worn out switch the best way is replacing them.(it is not an expensive item. Believed is made by "ALP") Good luck!

There was a problem with the rotary encoder on some of the Kaito radios, perhaps you have a similar problem.

You need the new jog wheel encoder. From ALPS! You need to write Degen and see where they can be had.

I find the E10 to as sensitive as the 1103, though with it's single conversion and where I live, it's more prone to interference and images. The IF feature helps a little. To be honest, if it wasn't on closeout at RS, I probably wouldn't have gotten it since smaller, cheaper double conversion radios like the 1103 and 1102 with ssb are available, which I own and cherish? Still it has a fine quality case, nice easy ergonomics, 500 memories (wow!) and the best audio of the aforementioned portables. Since I'm a ham, ssb/cw is important to me, but I was a SWL first, and this a fine rx even without that capability for those who don't need that feature. 73, Jerry.

I find the DE1103 more sensitive than the E-10 or E-100, especially on AM. The E-10 is not as bad on SW as it is on AM which adds a lot of hiss to weaker AM stations. It does have awesome sound though. Overall I pick the De-1103 as the best of the group and the E-5 is at least as good as the DE-1103 with better ergonomics.

From: yzordderrex2003
Topic: 466 Message: 466

I too suffer from some distortion but I think most of it is from fading. As an experiment I plugged phones into the line out jack last night. I think distortion was still pretty harsh. The volume wasn't quite as loud as I would like. My hearing is not so good anymore so maybe your ears are better and the volume out would be fine. So take a listen with your phones plugged in to that hole. I'm probably going to order the Kiwa mods and install myself.

I dunno,

I usually wait till radio shuts off by itself and then charge for 8 hours. I should really get a charger and another pair of batts. I think a real charger will shut off when battery at the top of charge. Maybe Degen's next revision will have better charger. Love the radio otherwise.

Bob,
I did the Kiwa mods including the audio drive resistors, the audio caps and the ESD diode protection network for the antenna. Now, my radio was pretty darn bad when I first got it as far as the audio goes. Now it sounds very good. The internal speaker is a big limitation when using it that way, but after the mods it is listenable. Through a good set of ear buds or connected to some small (Logitech s-100 $9.00) powered computer speakers, it sounds great. When I first got the radio and compared it to my Sony 7600GR, it sounded like junk. Now I actually prefer the sound of the Kaito 1103. It is less muffled and intelligibility of weak signals is better than with the Sony. It seems that some of the radios did not suffer as mine did from the nasty sound, but if you think that you have a distortion problem or want better audio in general, it is worth doing.

Note: see the audioMods-1103.txt document in the files section written by Gary Thorburn and verify your resistor values before doing that mod. It seems that some radios have the correct parts installed, some do not.

Here is an excerpt from that file:

There is a resistor network which feeds the audio output from the TA2057N to the CXA1622P. It forms a voltage divider which attenuates the signal entering the CXA1622P.

Part numbers are printed on the board, to easily match them to the schematic. I discovered that R223 and R224, which are part of this voltage divider, have the value 1K on the schematic, but my radio had 2.2K resistors soldered onto the board. (these surface-mount resistors say "222"). This error results in less attenuation, apparently overloading the CXA1622P, driving it to distortion on strong signals. The presence of 2.2K resistors is probably a parts substitution that was made during certain production periods, perhaps by mistake. I have no way of knowing how many 1103 units are like this.

I soldered 2K resistors across R223 and R224 to bring the effective resistance to approx 1K. I'll call this the "KD1TE" mod, for my ham radio call sign. The result, combined with the Kiwa audio mod, is a very nice sounding radio. Of course, you don't need the KD1TE mod if you have the correct resistors already. The Kiwa mod alone will sound just fine.

Pete,
As to the internal battery charger, I read a review on Radiointel on the Eton E5 which apparently has the same charging circuit as the 1103. The author said that if you were using 1100 mA-h batteries it would take 11

hours for a full charge. 2300 mA-h batteries, 23 hours. I have never tested to see what a full charge on my 2500 mA-h batteries will provide, nor do I know what capacity your batteries are. Just to give you an idea, I read that AA alkaline batteries typically give about 4 hours of use in this radio. These commonly are rated around 1800 mA-h. If your NiMH batteries have the same rating (lets ignore the fact that the NiMH batteries have a much flatter voltage curve over their discharge period and put out typically about 1.2 V instead of the 1.5 V of alkalines)... From full discharge you would have to charge your batteries in the radio for 18 hours to get four hours of use from the radio. This gives you a rough estimate.

The best thing you could do is to get an external charger and a second set (or two) of NiMH batteries (perhaps some of the newer 2500 to 2700 mA-h units). A good charging unit can recharge the batteries in 2 to 4 hours and keep them on a trickle after that to keep them topped up. This way you could always have a set ready to go before the set in the radio were discharged.

I too suffer from some distortion but I think most of it is from fading. As an experiment I plugged phones into the line out jack last night. I think distortion was still pretty harsh. The volume wasn't quite as loud as I would like. My hearing is not so good anymore so maybe your ears are better and the volume out would be fine. So take a listen with your phones plugged in to that hole. I'm probably going to order the Kiwa mods and install myself.

I dunno,

I usually wait till radio shuts off by itself and then charge for 8 hours. I should really get a charger and another pair of batts. I think a real charger will shut off when battery at the top of charge. Maybe Degen's next revision will have better charger. Love the radio otherwise.

Hi Phil,

Thanks for the head's up! I'll read Gary's files and for sure pay attention to the resistor pair when I open her up. My main receiver in the shack is a R75, so I'm no stranger to distorted audio. I've got a couple of Boatanchors that'll do me right until I get the moola to send R75 over to Kiwa. Hell, if the DE1103 mods go smoothly down on the bench I might tackle the R75 myself.

Glad to be a member of this group - tnx to everyone for the fine posts.

Okay, I've now had the radio sitting with no batteries and no power for 3 days. Today I turned it on and it is working fine. Presets were still present, clock of course had to be reset. Will see how long it behaves before it needs another long weekend of rest ;-)..

My second (and third) stint of radio 'power starvation' for 48 hours rendered no results this time - SW and MW were still just static with no stations. So I mailed the radio back to Hong Kong for replacement yesterday (at 2/3 rds of its price)! Hope the replacement works a charm...

This approach worked for me:

Download the jpeg file. Right click on image, save image. Then go to saved image, right click, select "open with." I used Adobe Photoshop Elements, but any photo program should work. Then resize to fill the paper, and print.

I had asked my pc board designer to plot it out for me and he gave me
I think B size drawing and also pdf files for main and cpu
schematics. I wonder if I should post pdf files.

Anyway they don't look too horribly complicated.

I posted the schematics that are already in the files section as a PDF file. I'm not sure if these schematics are what you were looking for.

Anyway, there is a new file in the files area called schematics.pdf
It contains the two schematics in both 8.5 x 11 inches and 11 x 17 inches.

Re:
http://tinyurl.com/osbke

If there's any others you need as pdf, just let me know.

Best, J

It looks like a serial number. They usually start at something like 10000
rather than zero, as it looks better.

Please recall if troubles began every time when started programing
certain specific functions. If this is the case avoid to repeat them
next time.
Since trouble(s) recurred all the times and needed to do over and
over again to "reset to default"(I mean removing the batteries for
days --- NOT simply press the reset key !) Highly suspect when
pressing certain command keys at wrong sequences, you were messing up
the DE1103's microprocessor program(s) (computer hung-
up/overflows .... the DE1103 microprocessor may not be very
forgivable !) Hope this helps.

From: dcriner
Topic: 450 Message: 486

The various buttons on the front panel are connected to the main circuit through a flat, multi-conductor cable. My theory is that perhaps this cable is making intermittent contact.

To check this, remove the 7? self-tapping chassis screws. (Don't remove the one screw that is immediately below the telescoping antenna.)

Separate the two case halves. If necessary, unsolder the two leads to the speaker so you can get better access. Wiggle around the flat cable and see if that makes a difference. If necessary, gently pull the cable out of the connector, and re-insert.

Good luck.

Topic: 450 Message: 487

The problem starts usually after the radio has been sitting turned off for several hours. Nothing unusual that I recall when I turned it off, just touched the power/sleep button. When I go to turn it on I tap the power/sleep button and it just fails to turn on. Sometimes if I keep pulling the batteries out, and holding the reset button it, it will turn on in the FM band but the volume cannot be adjusted and neither can the tuning frequency. The only common element when problem starts is that I had recently used the long wire ant. that comes with it. Next time it comes back to life I think I will stay away from the long ant. and just use the dipole and see if it stays alive longer than one week.

Mike,
Insert a new set of "Good" batteries in the first place and also check the keyboard cable connections as other member suggested. No harm to try nevertheless. Doubtful if the long wire antenna be a factor to cause problem(s). However it may indicate you are doing a lot of station searches afterwards in different bands of the radio. Did you use the --- "mechanical decoder/frequency tuning knob/jog dial ... whatever you called it !" --- and other function keys a lot then ?
Other than making incorrect program entry sequencies it can not rule out owing to whatever reason(intermittence, worn out/bad contacts, loosen cable ...) a defective jog dial as well as other function keys may "program" the DE1103 function incorrectly. However the LED display screen should likely display "ERR" or, at the worst, weird (garbages) symbol(s)at once -- and this is not your case. Personally believed it was sorts of a weird "lock up" problem. (Saw a "key" sign in the LED screen ?) Needless to say if you can "unlock" it the problem should disappear. Good luck !

Sorry to hear you got probs with your radio Mike. (I think it is Mike. Sometimes I have a hard time keeping up with thread.) I am not too qualified to comment on what may be wrong. I don't have too much experience with microprocessors, and problem seems likely to be in that area. Seems you have a lot of help here on the group so I will just add my $0.02. I would guess that Degen probably knows what the problem is, but not such a good line of communication between here and the factory - Most companies - especially in Red countries -not too willing to air their dirty laundry.

I would as a last resort try smacking the radio two times. Just slam it down on a tabletop. Just enough force to give it a good spanking without breaking the case. Hopefully you are not at last resort stage yet. I remember my cousin coming over to my house and smacking one of my radios twice and getting it up and running like that. His daddy (uncle Ivan) was a radioman in the USN and he learned that trick from him. I am a EE, so my method to get up and running is quite a bit different. Believe me when I tell you that I have spent hours trying to get a piece of gear up and running. I would surrender and throw my hands up in the air, only to have my technician get in there and tell me 15mins later it was just a loose connection. Look for the obvious probs. Loose connector, broken track, cold solder joint, etc...

One of the problems that the whole electronic industry has been seeing is tin whiskers. Their is a global push to get away from hazardous materials, and lead solder is an early fatality. Seems that the newer design lead free solders have a propensity towards growing little tin whiskers that can short out adjacent pins on high density lead frames. If Degen has recently made the switch then there is a good chance there will be some fallout. I don't really know exactly what it takes to inspect for this prob. We use stereoscopic magnifiers with bright lights. Perhaps you may want to look into this type of prob. Maybe just an acid brush sweeping between the high density connectors and integrated circuits may fix you up.

My method would be to get in there with some test gear and poke around. We have schematics available on site and plenty of the members here are very technical savy. A simple voltmeter might help to pinpont the problem.

Good luck,
Bob

Unfortunately many people tried such "magic" and ruined their survival equipments due to frustrations --- then "lost at sea" afterwards (die!). Uncle Ivan/USN is lucky to come through ---Just kidding! Even if it worked right away, this is a hit-or-miss approaches. Same problems will resurface sooner or later. Again, trouble shooting microprocessor problems are time consuming(even with sophisticated equipment). Doubtful if most of us have the time and expertise to carry out such tasks.

Yep, smacking the radio twice is a last resort measure. And yes again, opening up the unit may not be for everyone, especially when we consider the probability that the warranty will be void.

I still think the solution may be simple. A loose widget or a renegade tin whisker. Hell, sometimes just taking the thing apart and putting it back together is enough to fix it.

I am curious to see where this story goes.

regards,
Bob

I just remembered that both radios came with green batteries...
one set was green with markings/legends and indeed says NIMH
BUT the set for the other radio are just plain old GREEN without
any markings of any sort.

I think the radios originate from the same factory in China...so
maybe you got the plain ones...no way to tell if they are nimh or no I
suspect.

I just added a pic of the 2 battery types in the photo section...

I wondered about them also...
I just stuck em in my cheap little charger I got at wal-mart and it
fast charged them in no time..

The cheapo charger says it handles both nimh and nicad
so I guess its little brain figured it out...least i hope so.

That charger is 16.95 and comes with 4 aa nimhs and 4 aaa nimhs... a
steal!

I will post photos of the charger and the 2 radios I just got in the
photos section after i post this message ...the charger also has a
wal-wart for ac and a lighter plug for the car :-)

I just love these little chinese radios ...

Be careful about how fast you charge the Degen batteries. I had a Sanyo 1hr quick charger and the batteries got VERY hot. I ended up getting a Powerex C401FS charger that allows a 5 hour charge time. The batteries never get warmer than skin temperature and they hold a much better charge because each battery gets monitored individually during the charge.

The cheaper chargers tend to over or under charge some batteries because they monitor two or four batteries at a time. High temperature and inefficient charging will certainly kill the Degen batteries before their time.

BTW the batteries are 1300 NiMH.

Hi don sorry for the long delay in replying.
Sensitivity below 14 Mhz sounds the same. (no lab tests)
long wire sensitivity much lower than whip with pre amp avoided but
high up wire very quiet conpared to whip ant inside the house.
hope this helps

499. PLL/AGC "Chuffing/Chugging" Odd Even Gain Variations

Yahoo group: de1103
Date: 2006-06-30 12:57:13 UTC
From: genesilvernail
Topic: 499 Message: 499

Tale of Two Receivers

Reading all the good and some bad blurps on the WEB concerning and comparing the DE1103 I could not resist and so I ordered 2 direct from China.

Received both units after 10-12 days. I fired up the first unit and was pleasantly surprised that the DE1103 was sweet. Sometimes, rarely, things just feel and sound right this was the case with the first DE1103.

Expecting the same from receiver #2, I fired it up and immediately realized that I was getting 2 vastly different driving experiences.

The first receiver provided a pleasant highly admirable accounting; clean crisp tuning, good rejection, excellent sensitivity...this was a great receiver.

The second receiver was crap-o-la. When tuning any of the AM bands rather then a smooth audible transition between frequencies odd and even frequency steps 1khz 2khz 3khz etc. produce AGC rushing sounds, pulsation. Further characterizing the problem the odd frequencies 1/3/5/7... result in higher gain/noise (volume changes) in comparison to the even frequencies 2,4,6,8khz... Thusly there is a high-low-high... audio emination as you tune. It still receives OK (marginal) but side by side with the good receiver its anoying as hell and very obvious.

This is to post notice that if you are experiencing this characteristic while tuning any of the AM bands its not what the DE1103 can and should deliver. Something is wrong on receiver #2... alignment???....PCB trace/pad/component issues???I don't know yet but would love to find out if anyone else has explored/experienced such a problem? I remember some referrence(s) to this on the web and the author was left with a less then positive experience and therfore opinion of the DE1103.

If I had just ordered the one unit and received the good receiver, receiver #1, I would have declared, as many have, the excelence of the DE1103...if I had received receiver #2 I would have incorrectly called the DE1103 a below average implementation of what a dual-conversion receiver should be.

I purchased my receivers from Tao Qu, who in my opinion is Tops, an A number one person who bends over backwards in providing customer service. He has offered to replace the radio but if this is a simple issue that I can rectify without jumping the pond I would

rather do so as I intend to add modifications to this great receiver and have the gear and desire to do so.

I'm new to this group and really appreciate all the downloads that members have provided...thank you...it really helps.

Gene...Later

Likely you received one OLD and one NEW model; otherwise it must be a QC/quality control problem.
Please check their serial number as well as any tell-tale difference (Case, antenna mount, the flip over plastic stand, speaker screen (holes patterns), packings/cardboard box, labels, instruction manuals, scratched screws ... etc.)--- the way when shopping for an used car. Heard that the earlier version are troublesome years ago. Please let all us know your foundings.
Hope it helps.

I just pulled batteries from both receivers and as I anticipated they are batch brothers with serial numbers AI031448 (bad unit) and AI031454 (good unit).

I believe that in examining the radios prior to shipment the defect could be over looked. Does it receive?...yes. Does it work properly...no. The determination could be done easily with a simple test setup.

Connect the audio output to an audio frequency meter with minimal dampening or integration and set wide enough to detect passband noise. Preferably this should be an analog meter if man-in-loop is used. disconnect antenna(s) by jacking in an empty male connector to the antenna jack. Tune the receiver and observe variations on the meter setting a maximum criteria for accceptance. Perform this on all bands.

This could be automated with a digitized peak sample and hold design connected closed loop to a simple rotary friction drive pad to the receiver jog control permitting a package-sealed test. Checking on one AM band would have revealed my issue maybe not others I feel though. My instance produces at least a 4 to 6 db variation beween odd and even steps while tuning.

The issue has to do with alignment or pcb/trace/pad/component open/short or infantile failure of a component. Appreciate you thoughts...still looking and any idea's would be welcomed.

Actually I did a second 48 hour power starvation over a week ago, and so far it seems good. The difference between the first power starvation and this one is that after the first one when the radio went on the display would scramble for just a millisecond before coming on. Now when I hit the power button the display reads "on" and then immediately switches to the frequency it was turned off at previously.
I've actually been involved working with various electronic equipment over the years (radios, low-power radio transmitters, computers, etc.) and the wacking it a couple times has at various times been used with sometimes good results and sometimes not so good. I believe the technical term for this sort of action is "percussive maintenance" ;-) , but always to be used as only a last result. Thanks for the ideas and help.
-Mike

Here is a post by Vesa found in rec.radio.shortwave news group:

Hi all!

Out of curiosity I purchased 3 DE1103's, plan being to give them away to godchildren etc. Strangely one of the receivers was a poorer performer on FM especially. On FM the frequency display was off by approx. 100kHz.

To remedy the problem I had to take the set apart and adjust the quadrature coil of the FM-detector, T202 in
" http://lab.radioscanner.ru/schematics/de1103_main.jpg ".

Given this opportunity (reason to open the set) I inspected further. Rather surprisingly the circuit board of the radio looked really bad. All the components (SMD included) were soldered by hand! Flux residues were left uncleaned! Shield plates were all corroded and poorly soldered!

I checked the two other units and they were OK meaning they were manufactured in a proper SMD-reflow soldering process. Additionally the tiny screws attaching the main board to back cover were given a locking compound treatment. This prevents the screws becoming loose and rattling inside the set.

Now, the "bad" unit was labelled as "MK2", the OK radios were "MK4". I suspect it could be that with a new PCB-revision Degen subcontracts manufacturing of the radios with the remaining stock of old PCB's instead of scrapping the boards. Alternatively the radios just reflect the variation in chinese "domestic" quality. Hopefully export quality sets are all as shiny inside as in the following picture of an Eton E5:
" http://web303.server-drome.net/Eton_E5/E5_009.jpg ". Incidentally shielding of a "MK4"-set corresponds to that of an E5. My crappy "MK2"-set lacks the shield above the PLL (biggest shield in picture).

In conclusion the situation is rather awkward. It is impossible to tell whether a DE1103 is crap inside by the outside. Buing a "domestic quality" DE1103 from eBay really involves a risk of getting a crap product. One out of three radios was crap for me.

Greetings All,

It may be an issue that is effecting other PCB fabrication houses. Currently there has been a retreat of pcb work to the USA from asia suppliers having to do with ROHS compliance. Batches with rejection percentages of 70% I've personally observed. This was do to the lack of Pb in the process and improper implementation of replacement compiant processes. The god guru's suppossedly have this dragon tamed but not entirely so. The exact chemical and atomic mechanism that causes them is not known or fully characterized. With the lack of Pb in the process there are both corrosion issues (Macro) and the dendritic Sn whiskers (Micro).

Since the presence of tin whiskers is rarely obvious to the naked eye, mysterious system behavior, faults, or failures often occur, such as the shut down of Connecticut Millstone Nuclear Power Station in Spring 2005, when its Unit 3 reactor accidentally tripped because of a tin whisker in a control circuit. COTS (Commercial Off The Shelf)is at jeopardy for Aero-Space/Militaryand for this reason there is a list of exempts that may still continue the use of Pb in their processes.

Shoddy workmanship is still shoddy workmanship, but the evidence of severe corrosion on newly assembled components/pcb's potentially speaks to the loss of corrosion protection that Pb provides.

I have seen, in the last year or so, severe corrosive evidence in consumer products to the degree that it attacked the batteries...yes the reverse of the norm where bad batteries have leaked and corroded their holders and other metalization in the product. The batteries were being attacked along with other metals in the product before my eyes over a 30 day period.

The one example was a small line/battery powered radio from RiteAid that featured a line-in jack that I used for MP3 playback. It finally was trashed with rot throughout, no big loss ($20), but non the less amazing to watch it succumb to chemical reaction. The batteries, when placed in the product, where good tried and true proven batteries that where used in other gear within the same time frame.

Time will tell..still trying to make up my mind on returning the unit...think I will...If you polish a turd... it's still a turd. Corrosion, if there, makes anything eventually into a turd.

Cheers...Later

Gene

Your post is very informative, and a little depressing. At one time I was convinced Degen had overcome quality control problems and I recommended the DE1103 to everyone. Now I can't do that, and am having second thoughts about purchasing a DE1104 and/or a DE1108 if either is ever released.

From: genesilvernail
Topic: 499 Message: 507

All,

Do not despair. First let me clarify... I have not as yet found issues with corrosion in any DEGEN receiver. I have yet to open up any DEGEN receiver for a physical examination. I was speaking to issues that essentially can effect any and all consumer and industrial grade products involving their reach for ROHS compliance.

DEGEN has been very straight forward and responsive on issues brought to their attention, a rare and extremely important attitude from a supplier. Secondly I have dealt with Tao Qu http://stores.ebay.com/RADIO-AND-COMPONENT and he has been more then reasonable and equitable in problem resolutions involving any product he has sold.

As far as the yet to be released DE1108, DEGEN if wise will release a number of their first production runs to qualified beta testers and thereby reap the rewards of early-on problem identification and correction prior to a formal release.

In the restaurant business when you open a new property you give away food (product) for awhile to iron things out. Prior to tooting your horn only to fall squarely on your ass with real paying customers work out the bugs with unpaying customers, they have no grounds for complaint and generally will take ownership in the eventual success of the venture.

Because of DEGEN's commitment and past performance I will without hesitation buy more DEGEN product in the future as long as they have retailers such as Tao Qu and support such vendors.

Gene

Cheers...Later

508. Memory Scanning not with tuning knob

Yahoo group: de1103
Date: 2006-07-05 13:15:58 UTC
From: Pete Nalda
Topic: 508 Message: 508

Hi,
I have the manual I downloaded from our files section but I can't find where it says how to scan the memories though it does say it can be done. Thanks in advance if anyone knows.

"Egun On, Lagunak!" (Basque for G'day Mates)
Pete Nalda

509. I just bought another.

Topic: 509 Message: 509

I just bought a DE-1103. I have the Kaito unit and liked it so much that I bought the Degen. I'm going to open the Kaito up and attempt some of the mods here at the N9NEO station workshop. I figured if I made a total mess of the radio I would have the Degen. If I get them both modified and working nice I will probably give one to my niece. Last year I gave her the DE-1107 which is the analog equivalent to the DE-1103.

I have a little chirping when I tune the bands too, but not so annoying. Sound is distorted a little - though FM sounds nice. Looking forward to opening this one up when new one arrives. I'll post my findings when I get into it.

The only memory (preset) scan I know of is with the "knob". Press M/F
to change to memory mode and turn the jog dial (knob) to cycle through
the presets.
Where does the manual say there is another way to scan the memories?
(Per your subject line "not with tuning knob")

Topic: 450 Message: 511

I'm still having that problem with the jog dial so I took out all the screws I could find in the back. The top part opens but the bottom doesn't. I thought they'd be a hidden screw in with the batteries but I didn't find any....

I don't want to snap it off because there's wires going across...

This Russian site tells you how to dismantle the radio - I used an English translation of it that someone posted, but I don't have it to hand. The photos should help, though, even if you don't speak Russian!

Amazon.com has a .pdf of the 1103 official manual (Kaito version)

here's the link, shortened by using tinyurl.com
http://tinyurl.com/jolg9

scroll down the page until you see "Product Manuals",
it's just past "Product Details"

I have a Degen official manual in .pdf format but
I have no idea where I got it

The Kaito one should be identical though

The 3 radios I bought from Liypn came via certified airmail from China. They required a signature. 2 radios arrived the 7th day after Liypn's email confirming shipment, and one arrived 6 days after the email from Liypn.

Why would anyone go to "Amazon"?

If you bought from <lipyn>, you were provided with a <.pdf> file for
the manual.

It's in the <FILES> folder for this group.

When I received my DEGEN 1103 I wasn't at home and it was held at the post office pending my pickup and signature. Looking at the "Post Pack" padded envelope that the box arrived in, it was "registered mail" from Hong Kong via airmail and did require signature. From the day or ordering to arrival it was a full ten days.

From: yzordderrex2003
Topic: 522 Message: 522

I got a link in an email today that I thought some would like to see.
A bunch of papers from Dallas Lankford.

http://www.kongsfjord.no/dl/dl.htm

I was looking for a link to info on the Racal 6830, but the link has a
lot of other very nice info that would apply to group.

The second paper caught my eye because the distortion on my little
KA1103 is very harsh. I suspect that some agc mods might help out
some. I'll do the mods posted by Gary and dig a little deeper into
the agc mods. If I find any improvements I'll post to group.

regards,
Bob

524. AC Adaptor Issues

Yahoo group: de1103
Date: 2006-07-14 14:12:00 UTC
From: wd4dkv
Topic: 524 Message: 524

Hi to all...Received my DE1103 yesterday, and after reading the reviews am really quite impressed. Without going into specifics, I think it's a nice enough radio to take care of properly.

My only concern is one review I read about the ac adaptor apparently destroying a radio. I've had lots of experience with inferior ac adaptors, so I measured the voltage on the one that came with the set.

With no load, the adaptor is producing between 10 and 11 volts. The ripple seems to be quite acceptable on the one I got, and it would probably drop down a few volts when plugged into the set. Still, I am thinking about either finding one a little better regulated(closer to 6vdc), or just charging the batteries on an external charger.

Does anyone share my concern, and taken steps, or am I being overly cautious?

later, wd4dkv.

Hi WD4DKV,

I am DE-1103 newbie too. I have had it for a couple of months and I am very happy with it. I got my second radio yesterday. I bought the Kaito previously with the loop. This time I went for the DEGEN unit. I haven't had a chance to do a detailed comparison but the DEGEN does seem to have more of the pll tuning noise (I think i have heard it called chugging) as I go up and down the band.

Radio got here (MA) in six days from order Batteries were 1100maH and were marked ETON which surprised me. What did your batteries look like?

I don't think you are being too cautious at all. Nobody wants to smoke a new toy early on. Be careful when playing around with the wall warts. Your wart charger probably has some kind of current limiting resistor built in so that under load the output voltage is close to the battery voltage. Not a real good situation because the batteries may just overcharge some. Stick a 50 ohm resistor across the charger output and see what happens. If it goes down to about 5v then that is probably normal. You want a voltage that is about twice the battery voltage so that the simple circuit can have some control over the current. Think about the charger voltage, battery voltage, and series resistance some and you will understand.

I went for the RadShack charger and battery combo for 25 bucks. Expensive, but you get (and will want) another pair of batteries.

I wouldn't doubt that the radio might take a hit with that charger plugged into it without batteries installed. There seems to be some regulators before the big BGA micro, but I haven't looked everywhere to see where VDD goes.

If you have radio on Tuesday evening at about 8:15ish then look for me before greyhair net starts at 8:30 on 1945kc. I have just built a 160m transmitter and will be looking for reports.

Hi WD4DKV

My DE1103 charger/adapter is spot on at 6VDC. If I remeber there was a website which shows the adapter being cut open showing an LM7806 (or equivalent) 6 votls voltage regulator IC. In other words the adapter is a well regulated unit. I even use it occasionaly on my Sony ICF-SW7600GR which happens to have the same jack type, voltage requirement and polarity as the DE1103. I bought my DE1103 along with the DE1102 in Hong Kong way back in Sept or Oct. 2004 so I don't know if Degen had made any changes in there design on the adapter/charger. You did not mention if you're in US (I presume you are) because the included step up transformer (110v to 220v AC) reportedly outputs higher than 220volts. This can cause a higher than normal output on your charger/adapter. However if they are still using 6volts voltage regulator IC then this will not have any effect because the IC can accept inputs up to 35VDC and stil comes out 6VDC. However if Degen doesn't use regulator IC's anymore (to cut on cost) then this can give you problems in your adapter output. Try to check first the output of your step up transformer (assuming you're using it) if it is indeed close to 220VAC and not higher than 240VAC.

As a note, the model number of the AC-DC adapter/charger of both my DE1102 & 1103 are exactly the same but they have DIFFERENT jack size and reverse polarity on the DE1102 compared to the DE1103. You can't use them interchangeably at all. Both use the IC regulator as the outputs of both adapter are spot on at 6VDC. I did not cut any of them open just to find out if it does use the regulator IC. I only based and assumed it on the photos I saw somewhere in the internet.

From: wd4dkv
Topic: 524 Message: 529

Okay everyone! Thanks for info. BTW, I am in United States, and was supplied with a 110vac adaptor. I disassembled my ac adaptor(HS-D6300); easy to do as it was not glued, only held together by 2 screws. Contains a transformer, 4 diodes and a 1000uf filter capacitor only. No regulator.

Anyone familiar with the part number? Interestingly enough(and I missed this before) the adaptor states 110v 50Hz. We have 60hz current here in the US.

530. More Adapter info

Yahoo group: de1103
Date: 2006-07-17 18:58:11 UTC
From: yzordderrex2003
Topic: 530 Message: 530

I also got the HS-D6300 adapter. I was surprised that I got a charger that was good for USA lines. I thought there was a converter transformer required.

I measured open circuit voltage at 10.28v.

Loaded conditions below

Load Vout Current Rinternal

27ohm 6.65v 246ma 14.7ohm
22ohm 6.30v 286ma 14.0ohm
15ohm 5.63v 375ma 12.4ohm

So to model the circuit we would use an ideal voltage of 10.28v and a near 14ohm resistor in series with this ideal source. This internal resistance is comprised of a few different things. Diode drops, winding resiatances and leakage reactance of the transformer. (The core flux does not link all of the secondary turns.) And probably some other stuff I haven't thought of.

It is this internal resistance that keeps the batteries from frying when you put the charger on. You need some sort of current limiting device and looks like the wart maker just used the transformer wire size.

Any transformer that is designed for 50Hz will work on 60Hz. The magnitizing flux has an inverse relationship with the frequency. F is on the bottom of the equation.

531. LiMH Batteries - 2200 mAh

Yahoo group: de1103
Date: 2006-07-18 19:07:50 UTC
From: dcriner
Topic: 531 Message: 531

I have two radios, a DE1103 and a Sony ICF-SW7600GR, both of which take four AA NiMH batteres. The DE1103 came with 1100 mAh batteres; the SW7600GR doesn't come with batteries.

I bought a set of 2200 LiMH AAs at RadioShack -- twice the capacity of the ones that came with the DE1103. The extra life really makes a difference, particularly for the SW7600GR which depletes batteries quicker.

Hey Bob, Just thought I'd let you know...we tuned into the 160m freq last night about 8:15, but down here it's sort of noisy. I turned on the ssb switch and heard some faint carriers in the background, but couldn't hear any voices!

Have also determined that while the adaptor doesn't seem bad enough to harm the radio, it has enough ripple to mess up ssb reception. Am considering using the 5 volt leg of a computer power supply to play/charge the radio. Don't see why it needs 6 volts if four nimh only add up to 4.8 volts. This, I would think, would be a safe voltage level. It remains to be seen what kind of rfi problems I'd be dealing with. Later, riley wd4dkv.

Topic: 524 Message: 533

Hi Riley,

It was very noisy here in New England last night and I am not sure if greyhair net even happened. I was up listening on 160m from 20:00-20:30 and nothing doing. BTW, the net is strictly AM. Static crashes here in MA about 20-40 over. At 11:30 a news flash came on. An oil tanker in Providence harbor went up in flames. I suspect it may have been struck by lightning. I wonder if they were doing a fuel transfer when it went up.

I would think the battery would filter out most ripple - sorta like a big capacitor. As a matter of fact you could model a battery as a very large capacitor with a small value resistor in series with it. Have you measured the ripple with a scope? I think there are some regulators in the radio that might get rid of some of the ripple. The 60Hz or 120Hz ripple is usually taken care of by the much higher bandwidth of the three terminal regulator. I haven't gotten into the circuits too deep yet, so not sure what is going on.

I bought a second radio to play with while radio alpha goes on the bench for mods, but I've got a half-dozen people here in work who want to play with my new radio. I guess I'll loan it out for a few weeks and see how many I can convert.

Were your batteries green? A dark colored marked Eton?

Do you have other radio gear?

534. battery chargers

Yahoo group: de1103
Date: 2006-07-19 19:33:15 UTC
From: dazphotog@aol.com
Topic: 534 Message: 534

The reason for the 6.0 volts is that batteries ned to be charged at a higher voltage than the output boltage. This is usually 20% higher...so 6 volts on a 4.8 volt battery is about right. 5 volts would run the radio but not charge the batteries.

Hey Bob, Okay on all. We tuned in and couldn't hear anything but the noise, but when I turned on the sideband switch, I did hear a few carriers. I do this sometimes to check the frequency, since I can hear the heterodynes even when the am signals cannot be heard at all.

I have setup the de1103 for outdoor listening on my deck. Have it grounded and inductively coupled to the coax that goes to the g5rv. Seems to work fairly well, though a direct connection would be better! The adaptor is only a problem when listening to ssb. My adaptor does not have a regulator, only the transformer filter and rectifiers. My other equipment consists of an icom 730, which I use mostly on cw and digimodes. Also have a Hammarlund HQ-100 working , but in need of further tweaking.

BTW, the batteries that came with my de1103 are 1100ma Etons. I am using a new set of 2500ma batteries and an external charger. Will probably use the adaptor only if I am traveling in an emergency.

Later, Riley wd4dkv.

Hello de1103!

I'm a new one in this group.

A few days ago I received Degen and at the first day noticed the same problem when tuning: normal on odd freq 1,3,5,... KHz, but wrong freq and bad sensitiveness on freqs ends 2,4,6,... KHz in AM mode.

Is there any way to solve this problem, or only replacement of receiver?
Serial number of my receiver: A1031054

Sorry when my English is not so good (I'm from Ukraine).

What problems do you mean? I don't have any problems with mine, and apart
from a QC problems a few people have had, most people seem very happy with
their radios.

Kitkat,

Never had a problem with my DE1103. Two years of heavy use and it's still going strong. By far the best radio for the price. Is there a specific problem that you're reading about? Remember, there's a lot of people out there that will badmouth any radio.

I had a show-stopping problem with mine when I received it - couldn't pick up anything on any band other than FM. I sent it back and got a replacement from Hong Kong, and the replacement works fine. Another couple of recent buyers have had the same problem apparently, so it does make you a little wary. As I say, though, no problem with the replacement so far, and even with the extra 24 Euros I had to pay to ship the first one back, it's still something of a bargain...

Hi Kitkat,

I go along with the 'what problems' viewpoint. Before I bought the radio, I did as much research as possible and reached the conclusion, it was a superb radio for the price, but difficult to use due to the control layout. Ok you can't change the volume with one hand in the dark, but after a few weeks all the functions are second nature to use. You very rarely hear about problems developing with this radio, they are nearly all perceived problems on receipt. If there are problems, from what I read they are QC issues from the factory, not radios which generally fail in use. If suspect units are returned under warranty it should encourage the Chinese to tighten things up before leaving the factory.

I just bought mine and I am worried. The issue is when you do have a problem, if I am not mistaken you pay for shipping both ways (40$) to China and you might even pay taxes again if you can't convince the gov it is a replacement. It might be better to buy another one, depending on the issue.

If you've received one that works out of the box, you're probably okay (at least regarding the problem I had). Import duties are an issue I hadn't though about, though - so far, I've never had to pay any in France. If you do get stung for them, though (especially twice if you have to send a faulty unit back), the bargain could suddenly become much less attractive! I'd imagine that kind of bad luck is very rare though...

I've got both models going well into 6 months with heavy use; the Kaito 1102 and the Degen 1103. My only gripe is forgetting which one is in my hand and the difference in the way they operate (setup). After the year is up, in lieu of repairing them should they self-destruct, I'd problem opt for a new one at the price I paid.

552. Antenna Connection

Yahoo group: de1103
Date: 2006-08-02 16:01:46 UTC
From: locoradiodude
Topic: 552 Message: 552

Hello Group.
I have a DE1103 used with a small outdoor loop antenna (circumference about 17 ft.)feedline is twin speaker wire, connected via phono plug to the 1103. When the plug is completely inserted into the EXT antenna jack the received signal signal falls quite a bit (still audible), but if the plug is not fully inserted (lets say about halfway) the signal is higher, or if I directly connect the plug to the whip antenna (using an alligator clip) the signal is quite a bit louder than with it plugged all the way into the EXT antenna jack. I had assumed that the signal strength would be the same using an external antenna, connected through either through the EXT antenna jack or connected to the whip antenna and why the change in signal with the insertion point of the phono plug?
Curious in Radioland.

What frequency are you trying to receive, and is the antenna designed for
that frequency? Also, is the antenna matched to the radio input impedance?

Leon

If you will read the mail there have been different postings dealing
with issues the radio has.I believe the radio will get needed updates
that will make it even better.

The loop is a "random length" loop, and the frequencies are in the 6, 9, 11 and 15 MHz range. There is no impedance matching (not yey anyway), just a speaker wire feedline and phono plug.

See the all-new, redesigned Yahoo.com. Check it out.

That's probably why it isn't working properly. The antenna needs to be resonant at the required frequency and matched to the input.

558. Additional bands

Yahoo group: de1103
Date: 2006-08-04 19:19:58 UTC
From: Steve Dallape
Topic: 558 Message: 558

Hello all - just joined and am looking forward to participating in the group and learning much about my 1103 and radio in general. I have a question regarding bands that the 1103 is able to recieve, but that are not shown on the "analog" dial. I have a review of the 1103 from Monitoring Times that states that the 1103 is capable of receiving longwave, 120 meters, 18900-19020, 11 meters and the CB bands, but the frequencies are only shown on the digital readout. I know longwave is from 100 to 520 kHz, and the 18900-19020 is self-explanatory, but what are the frequencies for these other bands, and what should I expect to hear on them? Thanks.

11 meters is CB radio, starts at 26900 and goes to
27500 or thereabouts. 10 meters is just above I think
at 28000 and I don't know the others off hand but if I
come across it I'll check.

But you still won't be able to receive NFM station in the CB band. You can only choose between AM and SSB modes there, as in all other parts of the dial.

By the way, is NFM still used for CB communications in countries other than Russia?

Hello, Steve, Dmitry and all.
120m is a "tropical band" ranging from 2300 to 2497 kHz. It is used by some Brazilian and Australian broadcasters, such as ABC Northern Territory Service on 2310, 2325 and 2485.
The 11m band has not been used for international broadcasting since 2004 (approximately), but it is now allocated for local broadcasting in DRM mode (which cannot be decoded by the 1103).
Some DX catches are possible in CB (Citizen Band, 26-28 MHz) as well as in 10m HAM band (28000-29700 kHz) in the daytime. The call channel for CB operators in SSB mode is 27555 kHz, and it may be appropriate to start searching them from this frequency.

Actually, NFM stations are audible in AM mode, although with poor audio quality. It's better to listen to them on frequencies which are offset by +/- 1 or 2 kHz from the nominal.

> By the way, is NFM still used for CB communications in countries other than
> Russia?

Last year I heard some German operators in NFM mode in the "C" band (26965-27405).

562. Tuning SSB - help!

Yahoo group: de1103
Date: 2006-08-10 16:05:07 UTC
From: mcnowinski
Topic: 562 Message: 562

All,

I am a newbie having lots of problems tuning SSB with my Degen 1103. I have posted to the rec.shortwave group, and although I received many good responses, I am a bit embarassed to say that I still can't seem to make any progress.

Here is a quick summary of my current approach:

- tune in HAM channel on 75m in AM
- hear "Donald Duck" voices
- switch to SSB (typically, hear nothing)
- center "Fine Tuning" control
- make small adjustments (up/down) in an attempt to tune in SSB voice

Occasionally, I hear some "Donald Duck" voices break through, but it almost seems random. No matter how minutely I inch in one direction or the other, I do not seem to be able to "center" in on the channel.

Any ideas on what I am doing wrong? Any tips to make this process easier? Might I have a problem with my radio (I suspect it's more likely an operator problem:)?

Thanks for any and all input!

-matt

"75m" isn't an amateur band, try 7.0 to 7.2 MHz (40m band). You should hear plenty of Morse and SSB signals if conditions are good. Below 10 MHz LSB is used so it is best to start with the fine tuning control fully anti-clockwise when tryijng to resolve SSB on 40m.

Leon

From: Kenneth Lee
Topic: 562 Message: 564

I think mcnowinski is refering to 75-meters not 75 Mhz. The 75-meter band is the voice portion of the 80-meter band, from around 3700 khz up to 4000 khz.

Mcnowinski, try tuning down from 3995 khz in 1 khz steps while in SSB mode. Try this with the tuning wheel near the center position. Hint, often hams will center on even 5 khz steps so try centering on the closest 5 khz (3800, 3805, 3810...3995). This is a good nighttime band. You can often catch hams using am in this band too.

For 40-meters try 7000 - 7300 khz, nights and early mornings are best.

73, Ken -N5SWR

"75m" isn't an amateur band, try 7.0 to 7.2 MHz (40m band). You should hear plenty of Morse and SSB signals if conditions are good. Below 10 MHz LSB is used so it is best to start with the fine tuning control fully anti-clockwise when tryijng to resolve SSB on 40m.

From: Joshua Everett
Topic: 562 Message: 565

75 or 80m is a ham band. 3700 to 4000. 3933 on the east coast at midnight to 5am is a blast!

566. SUPER HELICAL SHORTWAVE AM RADIO ANTENNA sw ham cc dx m

Yahoo group: de1103
Date: 2006-08-11 19:47:20 UTC
From: s_dallape
Topic: 566 Message: 566

Anybody have any experience with this antenna?

http://tinyurl.com/zekrk

Does it work with the 1103, and does it work at all? Is it worth the money, or is there something else out there that is better? I am looking for something inexpensive and compact, mostly for SW, but would not mind if it worked for MW, too.

567. Re: SUPER HELICAL SHORTWAVE AM RADIO ANTENNA sw ham cc dx m

Yahoo group: de1103

From: knyuen88
Topic: 566 Message: 567

Such antenna is only good when its length is adjusted to a specific frequency for optimum receptions. Yet as a SWL it will be impractical to change its length every time when switching to different stations. In such case it only behaved as a non-resonant/broad band longwire without any advantage of a resonant antenna. The moral is: a 65 feet insulated wire (or whatever length -- not critical) of insulated wire will get identical results. --- why not simply use the DE1103 original longwire antenna instead! On the other hand, a 65 feet longwire antenna is not always desirable. It may overload the DE1103 and worsen the receptions in most circumstances.
Hope this helps.

In looking for an answer to a prior post on the topic "Reality", I wnet in search of the old group and could not find it. Has it been terminated? If so, too bad it could not have been cleaned up and preserved.

Anyway, Leon, you've done a great job in moderating the new group. It's a relief to be free of the flames and hate mail.

It should still be there. I check it from time to time, and post a message
about this group. The problem with the old group was that the
founder/moderator seems to have disappeared and Yahoo won't allow anyone
else to take it over.

Thanks, knyuen88 - you saved me from making a mistake. This sounded like exactly what I was looking for, but if the length has to be constantly readjusted, it will be more trouble than it is worth.

I've been listening to SW for over 50 years, and trying to listen to SSB signals for at least 40 of those years,and I *still* have difficulty tuning in clear SSB signals, no matter what receiver I'm using! So don't feel bad about running into problems! It's not your fault.

What I find causes the greatest problem is that the people you try to hear on SSB all too often pick the exact instant you are just tuning them in to *stop talking*!!!! This is particularly true when trying to pick up utility stations. Sure, sometimes you find a garrulous old ham who's in the middle of a monologue and then you can finally tweak in the signal to clear voice at the right tone, but it seems that 99% of the time, I tune across a frequency, hear the duck-quack, switch over to SSB, and begin to tweak the controls, and the voice disappears. It never returns while you are swishing the tuning up and down trying to re-locate it, and eventually you give up and tune elsewhere.

This is just further evidence of the essentially-evil nature of the universe...

And don't forget, when you do finaly get them tuned in, the other guy
starts talking and he's slightly off frequency and you have to do it
all over again.

oops sorry I forgot the text: Anyway here is:

I'm thinking of selling my KA1103 and buying a KA1102. Yeah I know 1103 new model, but the 2 keystroke volume thing is a real annoyance. I'm also finding I don't need the analog dial on the 1103 and therefore would almost prefer the keypad layout of the 1102. The reason I have trouble with the volume layout is that I sometimes have the radio in a pouch or briefcase and it's just too hard to find the teeny button (volume) and then have to jump to the knob quickly with one hand, a lot of the time I'm listening to the radio wile walking with my guide dog and so one handed operation would be a big plus in my situation.

So, I'm wondering, does the 1102 perform as well? Also, is ECSS possible or better on the 1102? Thought I'd heard it was good, don't remember where I read that. Also, hear the 1102 is smaller and wonder if that makes it more shirt pocketable, the 1103 fits but takes up the whole pocket.

Any other caveats or gotchas? Thanks in Advance,

Yeah, I own both. The 1102 is smaller, which is cool. Good audio through headphones. The 1103 sounds a little better with the built-in speaker, but it's close. Both have about the same sensitivity. I think I end up using the 1103 more, though, because of much better selectivity (two bandwidths) and better SSB-signal handling. Some of the ergonomics of the 1102 - like only being able to tune SSB from a specific memory page - makes the volume problem of the 1103 seem less annoying.

Hey, if you can give up SSB, you should try the Eton E10. Low noise floor and great sensitivity. I'm playing with THAT receiver more than any of the others.

Personally, I prefer the 1103. I believe it is both more sensitive AND selective. To this day, I don't understand why the 1102 is $1 more than the 1103 (typically) I would have gladly paid more for the 1103. I do'nt believe either are good enough to ECSS with. I have just about every portable known to man with the exception of a very few and find only one or stable enough to do that on.

The Sat800 is pasable at ECSS, as is the ATS-909 (barely) To do ECSS well, you need a radio that tunes with exceptionally small steps. Even 40hz steps (ATS-909) are pretty large. ECSS is easy on radios like the R-75, NRD-525, R8, etc, but these aren't very portable...

I've got both radios and side by side on the same external antenna, the 1103 appears to pull in weaker stations, more specifically in the amateur radio bands. I do like the 1102 for size and usually listen to it with head phones.

I'm glad you mentioned sensitivity. That's a big factor where I'm at
(Texas) and I'd hate to loose that. As for ECSS, well, I'll just
have to hold out until I find a sensitive radio with synchronous
detection. If there are no advantages to moving to an 1102 I'll just
stick with the 1103. I do like the backlight better on the 1103,
more soothing to the eyes, and I can live with the volume control
issue. Thanks again for responding

Hmm, so you're the 2nd so far whose said the 1103 has better
sensitivity. Although I don't listen to the amateur ops that much,
mostly broadcasts and some utes (Gander on 11175 some). There is the
portability factor still of the 1102 though and that volume thing.
Still I'm thinking pretty hard about sticking it out with the 1103.

I got my 1102 before my 1103 so I'm partial to the first. The 1103 is more sensitive off the whip, no question, but I found in a side by side comparison, they were equal when I used the 1102 with the short wire antenna and used the 1103 with the whip. The 1103 didn't gain much if at all with the wire. For ease of tuning and band scanning, the 1103 shines, pushing buttons to tune just ain't fun. For portability the 1102 is what I take if I'm cutting the carry-ons to the bare minimum, and just gotta bring one radio. For storing pre-sets, I find the 1102 much easier, still don't know if I have the 1103 figured out yet. I can live with ssb/cw only being in one page, though since I'm a ham, it's annoying. Go ahead, treat yourself, get both. 73, Jerry.

585. I opened up my 1103 and found

Yahoo group: de1103
Date: 2006-08-16 16:36:58 UTC
From: yzordderrex2003
Topic: 585 Message: 585

I opened the unit up and found the 2.2k resistors that Gary said to change. They were UNDER a piece of tin that looks like some more sheilding that was (might have been) added recently. Apparently DEGEN isn't paying enough attention to the Yahoo board concerning the 2.2k resistors. I'm going to do the Kiwa mods and see what else I can improve. I'm thinking of modifing the line output amplifier for a gain of 2 and using that to drive a pair of headphones with a volume control.

I wonder what the group's consensus is on the speaker. Is it the best deal that will fit in the space? I had an evil thought to trash the speaker alltogether and stick in a homebrew smd board in there with a precision AM detector and an eliptic filter. Maybe one of those Linear technology high performance filters. Run an outboard pair of computer speakers on a wall wart next to my bed.

I'm in a rush, so more later.

Regards,
NEO

P.S. Gary if you're reading this, we're practically neighbors. I'm in Uxbridge. I would like to stop by a BADX meeting or the BBQ in September. Sounds like a great bunch.

mmm, a little off the subject, but that just gave me an idea about my own little 1103 delema. I should try and search for a pair of phones with an line volume control, then if I ever needed to drop the volume really fast when mobile, woudn't have to navigate the volume button +tuning knob thing.

I'm glad you mentioned sensitivity. That's a big factor where I'm at
(Texas) and I'd hate to loose that. As for ECSS, well, I'll just
have to hold out until I find a sensitive radio with synchronous
detection. If there are no advantages to moving to an 1102 I'll just
stick with the 1103. I do like the backlight better on the 1103,
more soothing to the eyes, and I can live with the volume control
issue. Thanks again for responding

Yea but it doesn't impress me much. I don't care for the audio, and it has NO tuning knob. It is a very "boring" radio. Not to say it doesn't work well as it does. The synch detector loses lock quite easily which can be annoying but it IS fairly sensitive especially on m.w.

I wasn't trying to talk you out of it. I have nothing against it. I wouldn't sell mine but I like to fiddle with knobs, switches, etc and the 7600 is kinda boring although it is a tough act to follow in it's price class...

No not off topic Pete. Off topic is rec.radio.shortwave Heheh.

Rad Shack has the in-line volume control for pretty cheep I think. Probably Target and Wall Mart too. There is a mod here in the files section that swaps the volume control contortions with the ssb tuning knob. Looks like a fairly easy mod.

As I said in previous communication - I changed the 2.2k resistors to 1.0k and then I changed the 1uf coupling caps to 10uf. I didn't notice any difference in sound between the Degen which I had modified and my stock Kaito control speciman. I expected a richer sound with more bass response and less distortion. I also expected if nothing else the volume control would have changed so that I would have had to run a higher volume on the Degen as the voltage divider was changed. I found neither to be the case. I am old buzzard and half deaf, so that could be a problem. I don't know of any easy mods to take care of those probs:) I know there are some other caps I didn't try out yet so I'll report back when I make further mods.

The resistors I swapped out were 0603 size and my first attempt at smaller than an 0803. Gary's mod is going to be way easier to do if you don't have access to smd kinda gear.

Regards,
NEO

592. PLL Chip

Yahoo group: de1103
Date: 2006-08-18 01:19:26 UTC
From: yzordderrex2003
Topic: 592 Message: 592

I upload PLL data sheet. I don't have any experience with this type of chip, but probably not too bad to master. Maybe some way to program 10Khz steps when in MW portion so we don't have to use so many memory locations to program all mwdx stations in. If you have other datasheet to upload please do. If you think a seperate folder with data sheets already exist or should be created then please say so.

regards,
NEO

593. Initial thoughts on the KA1103

Yahoo group: de1103
Date: 2006-08-24 16:18:15 UTC
From: kf0oujf
Topic: 593 Message: 593

My KA1103 arrived yesterday. so I thought I would give some initial thoughts on it.

While I've seen complaints about the ergonomics of it, I don't see any problems - it's just different. Shoot, the numbers are even lighted at night, which even my TS-850s doesn't have.

The audio? Well, suffice it to say it's better than a crystal radio. Really, it sounds almost like a blown speaker (regardless of the internal one or headphones). Even the TS-850's audio is better.

The manual makes no mention of the rating of the included batteries, so I have no clue how long they are supposed to be charged. I gave them an hour last night, but I do not believe that was enough as on the bus ride to work this morning (1-1/2 hours) it shows them half discharged. Should have brought the AC adapter with me to work.

Speaking of the bus ride, it was a pleasure to have this radio with me. The little AM/FM I had been using on the bus would often lose the stations I listen to when going under overpasses and at the southen end of my trip (from olympia to seattle). I had no such problem today. A little weakening of the signal was all. This is one of the reasons for getting this radio. I got tired of hearing something interesting, only to lose an important part because of an overpass.

At the apt. where I live, I do have an image problem - a local station that broadcasts on 1280 kHz also shows up at 380 kHz. I double-checked this freq. on the TS just to be sure it really is an image. I suspect the transmitter is fairly close to my residence.

SW wise, it seems every bit as good as the DX-440 I had a long time ago. While I haven't run across an SSB station yet, I did test zero beating it against an AM broadcast, so it will be easy to work with for SSB, though I'd rather have a dial than a thumb-wheel.

Haven't used the external antenna that came with it yet, nor the alarms or sleep modes. And it does MW DX much better than the TS does (darn TS attenuates that band on purpose - can just barely pick up a Seattle station when it's xmitting at low power).

All-in-all, I'm quite pleased with the radio. Maybe someday I'll do that audio mod to it.

Surface mount gives me the chills.

Anyway, more thoughts...

At the bus stop in Lakewood (just south of Tacoma, WA), several images popped up in LW and MW. Since it's not a triple conversion radio, I'm not really bothered by these as they were all rather weak. And where I live, there is only one local station strong enough to create an image (about 18 miles south of Tacoma).

Using just the whip antenna, had some good reception last night of Taiwan, Japan, and some I couldn't identify since I didn't recognize the languages.

Took the batteries out to get their rating. So now they are fully charged.

Found a couple of SSB transmissions, and tuning them in went quite smoothly. Just as easy as any other radio I've used.

Still quite satisfied with it.

John

Hello.
I received my Degen 1103 from Tquchina abt two weeks ago.
I must say I am extremely happy with this little toy. For me it is pure gold!
No problem at all with the control volume, I think it is nice.
I have been performing also some comparitions wiht both a Sony IC2010 and a Grundig 700 and found no difference listening, among other things, to the 40 Mts Ham band.
I think also the audio, specially with the earphones is very good.
Believe me, since I got it, my Sony 2010 is resting on the shelf.
Note: Charge batteries during 12 or 13 hours in order to get a full charge.
I also bought four 2300 mah. batteries and a rapid charger (Less than 2 hour for a full charge).
And the best part: How much did all this perfomance cost?
49$ plus 20$ for shipping from China.

P.S: A Ham friend of mine, the Grundig Satellite 700 owner, liked so much the radio, I ordered another one for him.
It arrived yesterday.
Many Thanks to all.

Fernando, EA4BL.

I'm supposed to be getting my new 1103 tommorow or Saturday so I'll let you know how mine is. I had a Degen 1102 and it crapped out. By the way there is a mod for the MW sensitivity on the TS-850. Not too hard if you can work with surface mount components.

Subject: [de1103] Initial thoughts on the KA1103

My KA1103 arrived yesterday. so I thought I would give some initial thoughts on it.

While I've seen complaints about the ergonomics of it, I don't see any problems - it's just different. Shoot, the numbers are even lighted at night, which even my TS-850s doesn't have.

The audio? Well, suffice it to say it's better than a crystal radio. Really, it sounds almost like a blown speaker (regardless of the internal one or headphones). Even the TS-850's audio is better.

The manual makes no mention of the rating of the included batteries, so I have no clue how long they are supposed to be charged. I gave them an hour last night, but I do not believe that was enough as on the bus ride to work this morning (1-1/2 hours) it shows them half discharged. Should have brought the AC adapter with me to work.

Speaking of the bus ride, it was a pleasure to have this radio with me. The little AM/FM I had been using on the bus would often lose the stations I listen to when going under overpasses and at the southen end of my trip (from olympia to seattle). I had no such problem today. A little weakening of the signal was all. This is one of the reasons for getting this radio. I got tired of hearing something interesting, only to lose an important part because of an overpass.

At the apt. where I live, I do have an image problem - a local station that broadcasts on 1280 kHz also shows up at 380 kHz. I double-checked this freq. on the TS just to be sure it really is an image. I suspect the transmitter is fairly close to my residence.

SW wise, it seems every bit as good as the DX-440 I had a long time ago. While I haven't run across an SSB station yet, I did test zero beating it against an AM broadcast, so it will be easy to work with for SSB, though I'd rather have a dial than a thumb-wheel.

Haven't used the external antenna that came with it yet, nor the alarms or sleep modes. And it does MW DX much better than the TS does (darn TS attenuates that band on purpose - can just barely pick up a Seattle station when it's xmitting at low power).

All-in-all, I'm quite pleased with the radio. Maybe someday I'll do that audio mod to it.

Topic: 593 Message: 597

John,

I have posted about this before, but in case you missed those posts, I will reiterate.

I got my 1103 the same day I got a new Sony 7600GR. I first listened to them side by side and I was sure that the 1103 had a blown speaker or something. The Sony sounded so much better it was incredible. I had bought the Sony for my lady friend, but I was having second thoughts. I gave it to her anyway. BTW I made the mistake of having her there when I did the comparison.

I bought the parts for the KIWA audio mod and for Gary's mod, as well as the static protection diodes for the rod antenna from Kiwa. It took me about three hours to do the mods. It made a HUGE difference. The radio now sounds quite good. It is not high fidelity, after all it has a small speaker in a small enclosure. It is very clean sounding now and the frequency response is great for intelligibility on weak signals. The first time I turned it on for the lady, she just said "WOW what did you do to it?".

A few weeks ago I borrowed the Sony back to do some testing. I was very surprised to find that I found that the 1103 actually sounds much better after the modifications than the Sony does. On top of that it is more sensitive and even with the AM Synch on the Sony, I could listen to fading signals better with the Kaito.

The bottom line is that if/when you get around to doing the audio mods to your radio, I think you will be amazed at the significant improvement in the audio produced by your radio that you will hear!! Doing the mods for me has meant the radio went from being quite fatiguing to listen to ...to being a pleasure to use!!

[SNIPPED]

How odd (from my standpoint). My UNTOUCHED DE-1103 sounds superior to
my 7600GR. It amazes me, the diferences in piece to piece samples...

My first DE1103 sounded very bad. The sound was kind of distorted, like a tape recording made with the sound level inputs set too high. The warranty replacement I received sounded much better, but not great.

I keep my DE1103 by my bed side and use it VERY carefully (still has the stickers). I already posted my complaint about the finish of my replacement radio -- it looked like someone used too much solvent to remove the excess cement from the edge of the face of the radio and as a result the grey color is faded looking in some spots. I just noticed that the face plate has started to separate a bit around the three buttons on the upper left corner. This is very dissapointing.

I have Sangean ATS800 that I bought locally from an radio repair shop many years ago that hasn't given me a moment of grief, and I use it daily. It is better on AM than the DE1103 to boot!

As for sound, my DE1107 is by far the best sounding little radio I have. Its kind of funny how the DE1103 and DE1107 are pretty much the same size, but they sound so very different.

My DE1103 sounds fine, it seems better than my Sony 2001D. The finish is OK
as well.

I just got my 1103 yesterday. I'm gonna order the Kiwa audio mod kit. I notice some audio distortion on strong AM broadcast stations. It sounds like the classic 1103 audio problems I have read about on the forum. Other than that it's a great little radio. Performs as well as my 2010.

Sounded like you got a refurnished one from someone's returned unit.
Check if there is any telltale revealings. (scatched screws, trace
of sticker markings ...)

Wow, DE1107? What's that? I thought they just now came out with the
DE1106. Haven't heard anything about a 1107 yet.

I fully agree with you Leon.
Mine, at least, is perfectly finished and the sound is excellent.
It seems there has been some quality control related problems.

My experience with the distorted audio is only on very strong AM stations. On the weak stations is not evident.

It never dawned on me that I may have gotten a refurbished unit. The stickers are still applied to the case and the screws appear unscratched.

I thought it was just a QC issue. Reading the posts in this group for a long time now, and it appears some 1103's are real dawgs while others shine. In other words, buying one is a crap shoot. Anyway, I emailed Degen directly to voice my dismay, but it will probably fall on deaf ears as the warranty period has expired for a while now.

All,

Thanks for so many great tips. I have tried them all, but have never successfully tuned in an SSB transmission...:(

I am now wondering whether I might have a defective unit - but have no idea how I can verify this. As a newbie, I continue to suspect operator error - but with each unsuccessful attempt, I become less sure. This unit was purchased from an overseas seller on EBay - so warranty work, if needed. is probably out of the question.

Any ideas?

Thanks,

matt

Did you try tuning in a strong AM station then try listening to it in SSB? If the receiver is working you should be able to tune an AM shortwave broadcast and listen to it in SSB. If this doesn't work then you should get a replacement if that's an option.

Subject: [de1103] SSB...I'm an idiot or my Degen 1103 is broken!

All,

Thanks for so many great tips. I have tried them all, but have never successfully tuned in an SSB transmission...:(

I am now wondering whether I might have a defective unit - but have no idea how I can verify this. As a newbie, I continue to suspect operator error - but with each unsuccessful attempt, I become less sure. This unit was purchased from an overseas seller on EBay - so warranty work, if needed. is probably out of the question.

Any ideas?

Thanks,

matt

Matt,

1. Set the frequency to a local MW AM station.
2. Switch to SSB mode.
3. Adjust the Fine Tuning so that the loud whistle you should be hearing goes lower in pitch to a near zero beat frequency.
4. Check if you have relatively equal travel from this position to the end stops of the Fine Tuning control.

If all above behaves as expected, your radio is capable of demodulating SSB transmissions.

As tuned in (3), you are actaully receiving AM in Exalted Carrier mode. You might find this advantageous when is causing serious distortion.

Now the DE1103 is not a great SSB radio, nor a great ECSS mode receiver - Exalted Carrier Selectable Sideband. One reason is that you cannot position the Fine Tuning far enough for the IF filter to slice off one sideband. You can shift it by 1 kHz to get more of one sideband than the other. Here's how:

5. Having tuned a SW AM broadcaster as in steps 1-3, now tune down by 1 kHz. You should hear a beat note of 1kHz.

6. Readjust Fine Tuning for zero beat. Now you are in ECSS mode, preferring the upper sideband. Note the position of the Fine Tuning control relative to the end stop.

7. Retune to the broadcaster's frequency but 1 kHz higher. If you have not diddle FT since (6), you should hear a beat note of 2 kHz.

8. Readjust Fine Tuning for zero beat. Again you are in ECSS mode, preferring the LOWER sideband. Note the position of the Fine Tuning control relative to the end stop.

SSB transmissions normally have no carrier but the missing carrier is frequently on an integer multiple of 1 kHz. Let's try to get some:

9. Having uned to a broadcaster you can trust to have a carrier on an integer multiple of 1 kHz, at step 3, 6 or 8 your radio is ready to pull in SSB transmissions also on an integer multiple of 1 kHz. Step 3 will work equally well for LSB and USB; step 6 favours USB, 8 favours LSB.

10. Tune through the 40m and 80m ham bands at night (both LSB) and the 20m (USB) and 40m ham bands day time. Some SSB stations should jump out with intelligible audio. Others will sound pretty strange but they can be tuned in with practice.

11. Once you have succeeded with the SSB signals at multiples of 1 kHz, play around with main tuning and Fine Tuning to try to clarify the others.

Good luck,

Tom VE3MEO

From: Damon Cassell
Topic: 613 Message: 613

A new Degen DE11 has popped up on eBay. This radio was mentioned on Radio Intel (www.radiointel.com) as a new model. The auction has an actual picture of the radio. It appears to be exceptionally small, smaller than an 1102.

Unfortunately the radio being auctioned is in Australia and is not being offered by one of the usual sellers (liypn, tquchina); exchange rate from Australia is not favorable. I wonder how long it will be before the Chinese sellers offer this radio in US dollars?

http://cgi.ebay.com/DEGEN-REDSUN-D11-NEW-POCKET-MODEL-SW-FM-AM-1000-presets_W0QQitemZ300020598963QQihZ020QQcategoryZ129254QQssPageNameZWD1VQQrdZ1QQcmdZViewItem

Scroll down for actual pictures... also, specs are provided.

From: yzordderrex2003
Topic: 614 Message: 614

I'm going cross country down Old Route 66 into SoCal. The trip is mainly sightseeing and some MW DX. I'll log as many MW and 75m as time allows.

MY DE-1103 is going to be my main mode of receive. I'm about to build a Loop antenna for MW and 75m but I'm not too sure how to connect it up. If I stick antenna directly into J1 it looks like I will still have to trick Q3 into turning off. Is this so?

regards,
Bob

No. Simply tune the loop antenna resonate to the designated station (s)---frequencies --- will be fine. If you are not very sure the outcome, keep the loop antenna to the "zero-in" station direction and rotate the DE1103 body around (with the loop antenna still connected) and compare the signal differences. Hope it helps.

For MW passive coupling works best, for 75-meters you'll have to plug-in.
For shortwave loops see this link.
A Magnetic Loop Antenna for Shortwave Listening (SWL) by KR1ST
http://www.kr1st.com/swlloop.htm

Or just plug in as much wire as you can stretch out.

I haven't seen that Radio Intel mention, but looking at the listing on Ebay and claiming it has all the features of "It's big brother the 1103" is a bit misleading. Top of frequency range appears lower and I don't see anything mentioned about SSB.

Mine arrived on 8/31 and the ergonomics seem fine. Kaito really made radio engineering history with the awkward volume control, but I am slowly getting used to it. Personally, I think they were looking to cut costs by eliminating the need for another potentiometer, and in return we got sideband.

No problem with the sound on this unit unless the station is really strong, and I am parked about five miles away from three 100KW antennas on the MW band. No big deal though, the sensitivity is awesome!

I have noticed a weird little quirk when changing batteries; the radio is locked up after the change. In one instance the batteries were changed in well under a minute, and all frequencies stored in memory along with the time were completely lost. The weird thing is that I pulled the batteries one more time and the frequencies AND the correct time came back!

Anybody else seen this?

Quirks aside, this is a great little world band portable for under $100.

Tim

That's a common problem, mine does it as well. I press reset which keeps the memory contents but I lose the time setting. A large capacitor across the battery connector might cure it.

Leon

623. Anybody know what is in that loop antenna?

Yahoo group: de1103
Date: 2006-09-06 01:19:43 UTC
From: yzordderrex2003
Topic: 623 Message: 623

I had a brainstorm this afternoon.

I have been playing around with some homebrew loop antennas for a trip I am taking. The point of the trip is a cross-country MW Dxpedition. That's right, I hope to log as many of the little 1kw broadcast stations as I can on a 14 day coast to coast journey using my KA-1103. I just built a 9" loop that I couple into the internal ferrite rod with no electrical connection. It works nice but is a little cumbersome in that I have to stick the radio inside the loop in order to get good results.

I am considering putting together a larger loop antenna and trying to use the KA-31 amplifier to resonate with the loop. Anybody know what's inside the loop as far as a variable capacitor and an amplifier?

From: kwing175
Topic: 624 Message: 624

Can anyone give me the ins and outs of Wxfax with a KA1103.

I bought the KA 1103 hoping to recieve Wxfax signals and decode on my laptop while sailing. No luck receiving the signal here in Houston,TX.

1. Is this the correct radio? Will it recieve WXfax signals?

2. Are there special antenna considerations?

I was sailing in Norway this summer and a friend had a little SSB reciever made by NASA Marine (sold by SITEX in the US). The laptop was running "Weather Fax 2000" the results were superb.

Any help appreciated.
Keith

See and read http://www.kr1st.com/swlloop.htm
Scroll down to "Coupling loop."

Just above en under you will read this:
The main part of the SSTML is now finished. You can already test it by holding the whip antenna of your shortwave receiver very close to the upper half of the loop and tune the receiver to, say, 15 MHz. Rotate the tuning wheel clockwise until it doesn't go any further. Then slowly rotate the tuning wheel counter clockwise. At some point you will notice an increase in the noise coming from your receiver, and perhaps you'll even be able to hear the WWV station. There will definitely be a peak in the noise, and when you rotate the tuning wheel further, the noise will decrease again.

The next step is to build the coupling loop that will pick up the energy generated in the main loop and offer it to the receiver.

Coupling Loop

When you look at the many designs of magnetic loops on the internet, or in various other publications, you'll notice that there are different ways to construct coupling loops. Some don't even use a loop, but a gamma match to connect the magnetic loop to the feedline. However, this would require another variable capacitor. Other designs use a coupling loop built from coax cable, and the center conductor and braid have to be connected in a certain way to minimize noise pickup. I've experimented quite a bit with different types of coupling loops, including complex ones built from 4 pieces of coax, but I noticed no difference in performance compared to the simple wire loop. So let's keep this simple.

I constructed the coupling loop from solid #14 house wire. The size of the wire is not critical at all; just pick a size of whatever you have laying around that will keep its shape once mounted on the PVC support pipe. The length of the wire should be about 2 feet if the circumference of the main loop is 10 feet. In other words the length of the wire for the coupling loop is one fifth of that of the main loop.
++

Have a nice trip and/or brainstorm!!!

> Probably Target and Wall Mart too.

I tried using one of those gadgets for dropping the line-out level to something the mic input of a digital pocket recorder would accept, until I discovered it was simpler to just connect the recorder directly to the earphone jack and turn the radio down to about "2" (the 1103 is very quiet on batteries, so this works), and listen via headphones plugged into line output. But it also works as an attenuator on longwire ant, though I now have a 4mHz highpass filter on the longwire (due to nearby MW AM stas) and the lo/dx switch provides sufficient control.

Panasonic RP-HT355 phones are modestly priced, comfy, and my main listening phones for radio/TV/computer, have vol control inline at the Y of the cord (mid-chest level). Note these are bass-ported, so I would not call them "hi fi."

Sony MDR-V250 also inexpensive, smaller (rest on rather than going around ears), plus have the rare feature of a mono/stereo switch in the line along with a vol ctrl, making them very handy commo cans.

Got both in local-chain dept. store. Don't remember the price of either but I'm poor and wouldn't have spent more than $30 on headphones.

> alarms or sleep modes.

The sleep mode is one of my fave features; it is extremely convenient.
Just punch in 3-0-(pwr) and nighty-nite!

Another very thoughtful design feature is that you can turn it off
(one touch) even when the keypad is locked, as after finding a station
I ususally lock it, as any nudge of the protruding knob will bump it
off station.

Remember the lo/dx switch. I do have to toggle that continually while working up/down the MW AM band.

Check eBay again; I see our friend Lipyn is offering them now. $35
plus $20 shipping; wow cheaper than my 1103 was.

Which made me wonder. The photo of it at
http://www.radiointel.com/Radpic/kaito/ka11.jpg does not reveal "dual
conversion" lettered on the case, so I doubt it truly has "all the
features of its big brother" as claimed on the Aussie site. At least
until I see specs.

(The only dual-conversion pocket-size I know of is the Tecsun R9702,
which has no BFO and is not quite as senstive, and analog with only
X.xx mHz digital readout, but is very easy to use, has stereo FM on
the earphone jack, and a lot of fun. However it seems to no longer be
in production.)

Hey, what happened to Degen China's home page? I never bookmarked it
and can't seem to find it in Google.

Depends on which rev. of the 1103 you have. My Rev 2 (dated "04 05
03") purchased in July 2004 (so we presume was made in May 2004)
accepts MW on the ant jack, but at some later point this changed,
which is why someone makes an inductive coupler to place by the
internal ferrite coil.

I have read that the trick of scanning down from the "magic frequency"
to set a memory button below 100kHz will enable the ant jack
connection for LW without making any mods, but having the early model
I have not been able to confirm this nor determine whether it works on MW.

Yup. I found the secret is to not rush it. Wait a few moments between removal and replacement, then put 'em in carefully.

The original supplied Degen NiMHs were discovered to be a mm or two shorter than standard, which caused some intermittent connection problems.

So I think the problem is a momentary power blink caused by fumbling the batteries during insertion, confusing the radio. My original "short" batteries have since worn out and have had no probs since replacing them with Energizer 2500s.

> No problem with the sound on this unit unless the station is really
> strong, and I am parked about five miles away from three 100KW

Sounds like you're in my neighborhood, known among the locals as Portland's "Bermuda triangle of the AM band." I resorted to spending about $30 on a high-bandpass filter for my crude longwire, as the overload-images went all the up to 6mHz, and I still get some harmonics. (Now that 620 is multiplexed onto 1190 plus 1190 running IBOC during daylight hoo-boy. BTW, KEX is 50KW but the others are 10.)

Some unfortunates who live between Jennings Lodge and Town Center get QRM on their phone lines, wacking their dial-up modems, and probably on their toasters too.

Anyone else find it strange that the name 'Degen' on the radio is masked by the 'NIB' bubble in the photos? At least I assume that's what's under there, but it dosn't say Degen anywhere in the text either for that matter (even the photo of the antenna manufacturer has the name masked out by a bubble). Strange...

Tom (and rest),

Thanks so much for your troubleshooting tips. As I was coming to realize, the radio is defective. It does not tune SSB, but AM/FM seem fine. Rather than returning it to China ($30 round trip), I have given it to my father-in-law (bedside radio), and purchased another 1103 locally. The new one is working great in SSB too!

Thanks again!

According to the Ebay rule(s) a German IT firm already used
(registed ?) the trade name "Degen" --- despite the fact that nothing
to do with radios ! Thus any saling item with the word Degen is not
allowed to sale in the Ebay.(see discussions in the "former" Degen
Forum months ago) In short it is definately a Degen radio.

PS Believe NIB means New-In-Box

From what I read here and there, this is normal : they say the memory contents are intact, but you do lose the time setting when you take out the batteries. Which should happen rarely anyway, since the provided NiMhs and the "intelligent" charger (indicating optimal charging time depending on use of batteriess since last charge) should keep them working for a really long time. At least that's what happens with the Degen one (shipped from China to France), I don't know whether they send the same charger with the Kaito (considering it is much more expensive while basically the same, my guess is they should...).

640. Quality control problems with DE1103?

From: texnote
Topic: 640 Message: 640

Hello,

After reading many positive reviews all over the web and here, I'm very interested in buying a DE1103. However I'm also concerned about apparently recent quality control problems with this radio - 2 samples from the same production run and serial number series can be totally opposite each other in performance. One fantastic, the other very poor. There have also been reports of problems coming up after a short time (see eham.net reviews when one user reports failure of the SSB detector within 2 weeks of purchase).

Is there any way the sellers in China can test the radios before shipping them? Or are there any indications this issue may be temporary and we should just wait it out?

That is why the radios are so cheap. Products like these are intended to be
imported by wholesalers and sold in shops. This makes it easy for the
customer to return a faulty unit and the shopkeeper returns them to the
importer for a refund, who then claims off the manufacturer. The
manufacturer can afford to cut corners with QC as the number of returns will
be quite small - it's a calculated risk. By importing the radios ourselves
we are getting them cheap, but taking all the risks on ourselves. If they
were imported in the usual way they would have to conform to CE requirements
(in the EC). That, and the rest of the distribution chain, would probably
add at least 50% to the price.

Old story, the Degen name cannot be used in Ebay for some copyright
reason.
As far as I know, 'NIB' stands for 'new in the box'.

Well said. While hardy souls (with sharper vision) are digging into such tiny things as these with soldering irons, the adventure of assembly ended for me when layered PC boards hit the scene, and only shopping or salvage exploits remain.

It's like thrift-shopping for computer parts; if I can get a pair of decent VGAs or CD-ROMs each for less than half the cost of new, and one is toast, I break even (more or less); if both are good, I've got a spare for fixer-uppers for friends/family. Mom's listening to her jazz CDs on a Soundblaster I snagged for $2 at Goodwill. A bad Caviar worked fine partitioned to only its first two-thirds, and was her main hard drive for a couple years.

(I've even dumpster-dived for useful parts; folks pull their hard drives but often leave useful RAM, CPUs and floppies. Then there was the notorious "Road Kill 486"--I ran over it one dark night after it must have fallen off a truck--which yielded 64MB of SIMMs that I badly needed, back in the day.)

But I digress. I guess I got lucky with my Rev 2 1103, though I finally quieted my desk down enough that I could connect its line output to my computer. I was dismayed when a look at the signal in an editor revealed the line output clips flat on the negative side at -6db, the only flaw I've found in my unit. However, the speaker output is not so impaired, so I still have a decent recording source, though not quite as convenient.

How I beat back some of the RFI: For those who recall my struggle to make a useful antenna in my apartment despite my inability to string visible wire or wind a coil, I put a TV balun across my hidden 30' wire (stapled under eaves, which curiously attracted a brief inquiry by the cable TV company) and ground, feeding coax to my $28 I.C.E. highpass filter (due to 4 AM BCs within 3 mi) and a shielded audio patchcord from there to the receiver. Fiddling with the antenna connections, I discovered by reversal that the balun was bad (open on one side). Listening is much more pleasant with enough signal to leave the DX switch in "LO," and finally able to snag CHU, gaining hope to

hear some Europe as well as Delano and Asia here in the PNW.

Jeff

The tuning wheel stopped working again for the 3rd time, unfortunately for good. I'm going for another brand as Kaito appears to have serious quality control issues. I'd like to find something that isn't manufactured in China as their goods are fast becoming a major part of the "throwaway" market.

Just an idea. I noticed that when i did the Kiwa mods on my 1103 the wires that are attached to the tuning wheel pot are very poorly connected. I removed the three wires, restripped them, and reattached them. Originally they were held on by a thread!! If you can remove the back of the radio and check these wires.

Good luck with your quest to find something not made in China! I have a Sony 7600GR, made in Japan, and the olume control doesn't work right, but maybe it just needs a squirt of cleaner.

When it first happened, I opened the radio and just jiggled the lump of translucent fixative right next to the tuning wheel and it started working again. I don't know why it started working again then and a couple of times after when the wheel stopped working. I don't really know my way around the insides of a radio, but I didn't have anything to lose by getting inside the case at that point. I thought perhaps the wires or the conglomerate of translucent stuff might have been touching something that it shouldn't have been touching or there was a bad contact, etc. so that's what I essentially did. I'm very disappointed that the 1103 died so quickly. I also bought the Kaito amplified antenna with it so I'm looking for another radio that can use the antenna given its connector. And I bought a nice pair of Klipsch Promedia speakers which I hooked up to the 1103 so I had a really sweet setup that was my bedroom stereo-shortwave-alarm clock. I'm thinking of getting the Sony 7600 if I can find it for a good price although I know Sony products have their problems also. I'm hoping the AC adaptor for the 1103 will work on the Sony since the adapter is sold separately which I find hard to believe but that is Sony's m.o. Buying consumer electronics has turned into a crap shoot lately. I bought an Onkyo receiver about three years ago and one of the rear channels intermittently goes out-ridiculous. I have receivers that I bought nearly 20 years ago that are still working perfectly; I have a Zenith pocket radio that was given to me nearly 40 years ago that still works so go figure.

Sounds like hot-melt glue, it's often used to secure wires in radios. If you
remove it you should be able to fix the bad connection to the rotary
encoder.

Interesting, and sad that this problem with your radio came days after I asked the group about quality control issues with the DE1103. Degen really needs to get its act together with QC. Believe me for some of us, myself included, $100 is not throwaway money, as little as $100 may sound to many people these days ...

I'm not sure what that means but are you saying if I buy another 1103
then I won't have the tuning wheel problem because the newer models
use a different technology? I'm tempted to purchase another one
because I loved the features on the radio and think it's a bit better
than the Sony 7600GR (and Sony does have its failures too) but I don't
want to be stupid about it. I bought my 1103 at a place called
Radios4You and it was $79.95 which is $30 cheaper than Kaito is
selling it for. I'm wondering if they may be selling a lesser batch
of 1103s because they're selling it so cheaply? I'm wondering if
whomever I purchase it from could test it for me so I know I'll be
getting one that's fully functional? Thanks for that bit of info..

657. Re: [de1103] Re: My 1103 Just Died- Tuning Wheel Stopped Working.

Couple of questions for the group...
Has anybody actually changed the encoder to find that the radio began working?
Do the Kiwa mods work for only the KA1103 ? or the DE1103 as well.

Let me digress -
A few weeks ago, I was looking inside my De1103 to determine how easy it would be to upgrade my sound (Kiwa mod) and replace the encoder. My encoder was quite flaky (De1103 is over 1 year old) before I opened it up. Typically, the jog dial problem goes away when the radio is open. This time the jog dial was bad with the radio open. I tested the legs of the jog dial - 2.85 VDC. My first thought was that the voltage regulator was going bad and the voltage wasn't enough to register as logic level high. When it did work occasionally, the voltage was still 2.85 VDC. I turned the wheel to watch the voltage alternate between 0 and 2.85 volts.

I managed to resolder the shield (with the four solder points) during this process. Then the jog dial quit working altogether. I resoldered the shield and the jog dial started working again. Now the error that I see is there is a glitch when the wheel is in a certain location and the glitch repeats when the wheel is 360 degrees from that spot. The numbers will increment/decrement opposite of the direction that the wheel is turned. That is DEFINITELY a jog dial problem, but one that I can live with.

I am interested in the groups opinions about why the jog dial would be affected by re-soldering the shield.

In my quest for a replacement encoder, I found that I had trouble finding a direct replacement. I ended up shortening the shaft and adding threads to the shaft of one that had no detents. I haven't replaced the jog dial yet. Following the addage "If it works, don't fix it". Unless I decide to perform the audio mods. But I did manage to think up something that may resolve the ergonomics of the volume. Many encoders have a push switch that allow you to turn the encoder and push in the dial to activate another switch. Why not wire that switch to the volume pads. Just an idea...

And the reason I ask about the Kiwa mods - I am 99% certain that the mods work for the Degen version. Same radio, different label, but I would like to be 100% certain. I have asked them directly, but have yet to receive an answer. I hope their response to payment is better. I also know that if I make the mods, then I will replace the jog dial too. I am not as motivated to open up my Degen now that the jog dial works consistently.

Best Regards,
Thad

Mushlee,

To give you some hope, I very recently purchased the Kaito 1103 from Radios4You. The reason that I
went with the 1103 is because it replaced my old Sony ICF-7700, which I enjoyed much. The 1103 has
the similar LCD analog dial as the 7700. The 1103 that I received from Radios4You is excellent! After
reading all the complaints on the net about the early 1103's, I was very hesitant to dive into the 1103.
To my pleasant surprise the new 1103 has been excellent! The audio is great, with very good sensitivity,
selectivity and stability, especially when listening to SSB or CW. I'm impressed with this radio! Also,
the people at Radios4You are very prompt, and a great internet vendor to deal with. I have been in radio
for over 45 years and have no regrets buying the KA-1103.

If there is a problem with a new KA-1103, at least you would have a stateside importer to fall back on if
needed, if you bought it in the country.

Hope this helps.

Ron WB9BDZ

It does help, thanks; I liked the service at radios4you.com and would like to get another radio from them so that makes my decision to buy from them easier. I think I'm going to try the Kaito 1102 instead of the 1103. I haven't read about any consistent problems with it and I think it's probably as good as the 1103. I really don't want to spend the money for the Sony 7600, which is twice as much as the Kaito, and I don't want to possibly make the same mistake twice with another 1103 as I would be kicking myself if it crapped out too.

I have the 1102 and I really enjoy it. It probably gets more use than any of my other portable receivers because it works almost as well as the 7600GR and is more portable. The 1102 and the DE-31 active loop make a great listening station for travelers.

661. Degen DE1103 Quality control issues

Yahoo group: de1103
Date: 2006-09-19 23:02:48 UTC
From: Claire Cruz
Topic: 661 Message: 661

Hi again!

The latest disturbing reports of bad batch of DE1103
is really disappointing
as I plan to get another copy of this radio since it
is one of the best
portable radio I have, even better than the more
expensive and made in
Japan Sony ICF-SW7600GR. I guess I might as well look
or wait for something
else. As to why Degen suddenly redesigned or changed
there QC on this
particular model is beyond me. On the initial batch of
DE1103 the AC-DC
adapter that came with it (the sealed ones) used 7806
voltage regulator
chip which gives it exactly 6 volts DC even when
loaded and is well
regulated I even use it on my 7600GR as the DC plug
and polarity are fit
for the Sony as well as the DE1103. The new ones
reportedly doesn't use
chip regulator anymore but just your plain
diode-capacitor configuration
thereby giving a "noisy" 10vdc output. The cost
cutting measure Degen did
is creating a big problem to new buyers. However the
smaller DE1102 seems
to be unaffected since there is no disturbing reports
of failures on this
model unlike the DE1103. I never had any problem with
my 1102 yet since
using it daily since buying it in Oct. 2004 direct in
Hong Kong. My DE1103
is now stored along with my other radios. I'm only
using the DE1102 (for
bed time) & Sangean ATS-505 (for SSB) at the moment.

Just my thoughts

Dennis, DV7-BKO
Bohol island, the Philippines

P.S.

Check this out if you haven't yet - the new Redsun
RP3000 dual conversion
Digital tabletop receiver. I'm looking forward in
getting this to replace
my not so impressive Tecsun BCL-3000. It has 1,000
memories, does SSB and
reportedly can receive VHF Air Band too (but no
squelch control).

662. Tuning wheel fix?

Yahoo group: de1103
Date: 2006-09-19 23:02:55 UTC
From: Claire Cruz
Topic: 662 Message: 662

Sept 19, 2006

Hello Thad,

Can you elaborate further the fix you did on your
DE1103? My radio (bought
Oct 2004 in Hong Kong) exhibits only an intermetent
jog problem (back
spinning of frequency). I opened it one time and blow
hard on the encoder
and it seems to have fixed the problem for a few
weeks. I have put the
radio in storage now along with many other receivers
but I'm interested in
finding out a permanent fix on this problem. Are they
using an optical
encoder similar to a mouse? If they are then that
explains my situation
since I live in a dusty country. So maybe a good blast
of compress air can
help.

By the way the new Alps brand encoder they're using
reportedly has different
pin configuration, Degen has to redesign the PCB of
the new batch to use
with this encoder.

Dennis, DV7-BKO

Thanks for the URL - the group is not listed in the Yahoo Groups directory and has been classified as Adult.

Nary a soul is looking there now - only one posting in each of July and August but, amazingly, nearly twice the membership of this group despite everything. Most must have switched off email messaging or were relieved when the onslaught let up.

Tom

It's a mechanical encoder. They are more likely to be affected by dust, I'd
have thought.

Topic: 662 Message: 665

It should be a mechanical encoder. Dust, as well as loose particles inside, will cause the jog dial to act spuratically. As the contact goes from not-connected to connected, some of the contact plating will rub off. I can still see the effects of this on my jog dial when I rotate it quickly.

I didn't actually repair my encoder, per say, but the interesting thing was that the encoder appeared to be functioning electrically even though it was not registering at the processor. It wasn't until I re-soldered the shield that the processor began to respond to the jog dial (i.e. increment and decrement). The edge of the shield happens to sit above the regulators that pull the two inputs high. The encoder pulls the inputs to ground in a pattern as your rotate the dial. Maybe the shield was protecting from electrical noise ? Maybe the regulators were oscillating because of the shield capacitance ? Maybe my soldering iron pushed some magic smoke back into some component that needed it? :) I guess the point that I was trying to make was that a dead jog dial might not be the encoder.

If I get around to replacing the jog dial, I'll open up the old one and share some pics.

BTW: What would be different electrically between the current encoder and an Alps encoder ?

Thad

What is the power source, batteries or mains adapter?

Rik and Gang,

Hi, new to this great group and I just got a Kaito KA1103. The radio has worked well for a few days, until today when it started doing this very thing. The radio would mute out in SW. I could get it going again by switching to FM most times, but sometimes I'd have to turn it off and back on again. It would receive a few minutes and back to mute out?? I am currently on charged batteries supplied with this radio. Any help would be greatly appreciated.

Try resetting it, it's a long shot but it might help. You might lose your memory settings and time.

Hi Ken,
I live in Chicago. What sort of referral are you looking for? We aren't the greatest place to shop for radios if that's what you're after. There are some shops that cater to recent immigrants and carry AC converters and portable shortwaves but frankly you'd do better shopping on the internet. I would recommend our museums though- Museum of Science and Industry (german submarine), The Field Museum, Adler Planetarium, Chicago Academy of Science, Shedd Aquarium and many more. You can email me offline if you have other questions.

Thanks for the replies. I'm looking to buy a 1103 and thought there might be a store which stocked them, to try out first, given the problems some have had. I bought a 1105 from China and it seems to work ok, 'cept it's a bit deaf. FM is super sensitive, tho.
Any thoughts on how long analogue transmissions will go on for? Or that digital isn't making the impact they thought it would have? Thanks and regards, ken

676. Re: Trick Tune below 100KHZ Ifyou want to

Yahoo group: de1103
Date: 2006-09-28 17:28:23 UTC
From: horacio_nigro
Topic: 292 Message: 676

Hello from Uruguay, in South America...

I bought my 1103 in Barcelona, Spain a few weeks ago, and now, back in my country I have time to read and re-read some of the most relevant postings in this group.

Regarding the below 100kHz trick,I am asking now if its effect is reversible?... I mean, sometines you need the ferrite nulling to avoid interference from different geographically located transmitters on the MW.

BTW, the receiver is very nice... have had previous experience with a Hammarlund HQ180 boatanchor... my personal reference to real DX receivers, then a Sony 7600G, a Grundig YB 400 and recently a Kenwood R600 and this new Degen 1103.

I enjoyed nice reception of the Spanish MW from Barcelona, with Algeria, Macedonia, UK, Italia being heard. Some aero beacons on the long wave... little shortwave, but I noted the rx as the most sensitive one I have had on hands with just the telescopic antenna deployed. I have been warned that the telescopic antenna in the DEGEN is very delicate, and it's recommended not to play with it too much.

Back in my country, SW reception conditions are spoiled by heavy local QRN which blocks the tropical bands of 60 and 90 meters. I have a 25 meter wire, end fed, and had built a magnetic balun, but it proves to be too much for the sensitive Degen. I am just using the ground connection of the coax cable to get clear signals.

I am afraid of the FET problem not only for the static, but for the signal overload to the receiver's front-end.

FM reception is great with stations received around 100 kilometers away. I am in a tall area of the city.

After my bad experience with the Grundig, I learned that I should better disconnect the receiver from mains when I leave home for work, every day. And also pull out the battery charger/battery eliminator off mains. I remember the Grundig was damaged one day due to a transient voltage from the AC line. That was my bad experience with the YB 400.

Best regards from

Horacio,
I didn't really understand the question until I read it again. I'll take a guess.

The 100k "Easter Egg" isn't a modification, it is really (I believe) a software bypass that allows you to go below the AM broadcast band. If you save a frequency into memory, you can always delete it later.

To the group,

I just uploaded a few pictures into a Jog Dial folder. I finally replaced my encoder and took apart the original one. I uploaded some pictures if anyone was interested in the internal of the jog dial encoder.

I'll give an update on my upgrade (Kiwa, resistor, and jog dial) results at a later time. Summary: I am very happy with my radio.

Thad,
Many thanks for the answer.

So I can guess that the ferrite disconnection that is subsequent to the 100k "Easter Egg", allowing a MW external aerial to be connected with the receiver, would work only from frequencies heard accessing from the memory saved in that way?

I have a confusion on this topic. Sorry..

My goal is that -more than possbility to listen below 100 kHz, I could tentatively connect a Beverage antenna(a 100 meter and more wire, resistor terminated) antenna in a future DX Camp.

I was refferring to :
http://groups.yahoo.com/group/de1103/message/292

I believe that you want to perform the following :
- Dis-connect the the ferrite bar antenna.
- Attach a beverage to the De1103
- Tune below 100k

Not that I could direct you if my assumption is correct, I am just trying to clarify so that those more knowledgeable might be able to answer. I did manage to remove the wires to the ferrite when I performed the Kiwa mods. Be advised that there are four connections from the ferrite to the board.

Go ahead and save 100k into memory. Try plugging in the long wire and listen for a difference. Since the Easter Egg is a software by-pass, the external antenna may still be connected.

Here is an interesting question :
If I start from 21951k and begin down. Then I stop at an AM station. Can I use an external antenna ? Is the radio still in ShortWave mode or did it switch to MediumWave mode ?

Thad

To answer my own question :
When you start from a stored memory (60k in my case) and search up in frequency, the external antenna in ENABLED, even in the WM frequencies.

However, the frequency in not on target. A local AM station 610 shows up at 640. But the difference between wire and no wire is very noticeable.

From: Phil Pasteur
Topic: 683 Message: 683

Horacio,

I think what you want to know is whether you can use an external antenna for all frequencies after implementing the "Eater Egg" software tweak. The answer is YES !

Once you go to your saved memory location below 100 khz and search from there, you will be using the Telescoping antenna, or if you plug in an external antenna to the jack, you will be using that, for all frequencies that you tune. You are not limited to this mode for only frequencies that you have saved into memory! I have to verify this, but I think that you stay in this mode until you turn the radio off and then on again.

You could use your Beverage antenna plugged into the external antenna jack for any frequency that you tune after selecting your chosen frequency below 100k. In this mode the radio does not use the ferrite bar at all. In other words you stay in the SW mode at all times and for all frequencies tuned via the jog wheel.

Phil P.

So I can guess that the ferrite disconnection that is subsequent to the 100k "Easter Egg", allowing a MW external aerial to be connected with the receiver, would work only from frequencies heard accessing from the memory saved in that way?

I have a confusion on this topic. Sorry..

From: ppasteur
Topic: 683 Message: 685

I have to admit, I have not played with this tweak all that much. I know that once you go through the process to start the below 100k/SW mode as long as you are tuning from that freq. you stay in SW mode. All freqs tuned when starting from that memory location will be tuned using the telescoping antenna or the external antenna. If you restart the radio, it resumes normal operation (using the ferrite for MW). I am not sure what happens when you are in the "SW" mode (forced by starting at the below 100K memory location), and then select a different memory location. Go ahead and play with it and see what happens. You can always get out of the tweak "SW" mode by restarting the radio. You can always delete the below 100k memory entry. So that you can't hurt anything and it all is reversable. Have fun, and let us know what you come up with.

Hello Keith,

I am sitting beside by DE1103. On the PC screen a weather fax from
Northwood UK is showing line by line. Yes, I am from Europe (Germany)
I have no problem receiving weather faxes from Northwood and Hamburg
(Germany).
As a software I am using JVcomm32. I would recoomend you to download
the demo version and give it a try.
THe only tricky thing is the slant correction. However, you can use a
time signal to adjust this. I think the help is only in German, but
you should manage to get through.
I think you have the list of all fax stations (Worldwide marine
radiofacsimile broadcast schedules form the NOAA?)
Give it a try. If you encounter problems I should be able to help you.

best regards

Kurt-Erich

I got a Maha Powerex battery charger for slow charging the Degen green batteries received with my DE1103 radio.

http://www.thomasdistributing.com/mhc401fs.htm

It monitors each battery separately during the charge. I noticed the first few times I used it, that one battery took much longer to charge than the other three. After a few cycles though, the charge time evened out. I suspect that using a dumb battery charger before getting the Powerex model, may have constantly under charged one battery while maybe over charging another to some degree. My DE1103 is still hard on batteries, but I do get longer play time from by batteries now.

I got a separate battery tester with the charger also, it comes in handy.

I check the voltage of each battery occasionally, they should be about the
same value and a faulty one is easily detected.

I also recommend a separate battery charger. Mine has
a light that stays on until it is charged. After that before
I would put them in the radio I would check battery voltage
using a voltage multimeter. By doing that you can tell which ones
charged at 1.40 to 1.5 Good. You will see which ones hold out well..
Those that stay down near 1.25 or 1.35 volts without load on the multitest
meter is suspect. rechargeables NImh are 1.25 but on the multi test meter
1.40 to 1.50 without load is good anything lower of that range after charge
is close to possible weakness under load.

Regular batteries are 1.5 volts usually 1.5 to 1.6v without
load..You can make the judgement after you have done
some recharging of Nimh or NiCad batteries.

Subject: [de1103] Re: DE 1103 sudden muting

I got a Maha Powerex battery charger for slow charging the Degen green
batteries received with my DE1103 radio.

http://www.thomasdistributing.com/mhc401fs.htm

It monitors each battery separately during the charge. I noticed the
first few times I used it, that one battery took much longer to charge
than the other three. After a few cycles though, the charge time
evened out. I suspect that using a dumb battery charger before
getting the Powerex model, may have constantly under charged one
battery while maybe over charging another to some degree. My DE1103
is still hard on batteries, but I do get longer play time from by
batteries now.

I got a separate battery tester with the charger also, it comes in handy.

Lets make this clear to everyone. The newer version has made the improvements to the De1103 Kaito 1103. So it you bought your unit some 12 or 18 months ago you have the old unit. Anyone buying the Degen 1103 from Tao Quo he Qa's them all before sending the units.

Tao Quo email and can be found on ebay selling the Degen 1103.
I will let everyone know my postings of stations. The latest version has addressed most of the problems with the Degen 1103 radio.

From Tao Quo sent to me...
Tao Qu <tquchina@...>
Thanks a lot for your email.

Actually we don't think you need to do this modification. The all DE1103 radio we are selling is the latest version and manufactured in latest data-code, DEGEN fixed the all known issue in this version already, so the any modification from internet is DIYs only, it is not must...-:)

The key improve on the latest version is change to use the APLS jog dial switch, the old version used is made by a Chinese company, the quality is not good....but the latest one is working well...

By the way, the attached is the schematics of DE1103, hope it is helpful for your upcoming DIY modification. -:)

Have a nice day!

Yes I agree too.

He has responded to my emails and just received
confirmation of my package! I cant sleep over this
radio..I have to wait until Wednesday to pick it up
at the post office.

By the way I received an email from him and he
has told me and in the past that the Degen 1103
radios have the latest upgrades and codes for
the radio. The issues that were being discussed
have been resolved to an extent to create a radio
that has minimized the problems of the older version.

Just below what he has emailed me
From Tao to me (Paul)

Actually we don't think you need to do this modification. The all

What name does he go by on E-bay and how does he list the radios - DE 1103 or Kaito or what? Are they shipped from Hong Kong?
I bought mine about a year ago and it is still going strong although I guess it may have some of the quirks others have noted. Is it worth it to get the lates model?

Thanks!

Topic: 700 Message: 700

Hi all,
Degen 1103 is very good, but the DE31 loop antenna is fantastic! There is only a little problem: antenna amplifier have his own batteries and the current drawn is about 10mA: it isn't very low...

If I use the SLEEP function, radio is switched off but antenna preamp remain on. I'm thinking to insert a phantom power on the antenna jack of the radio. Does anyone have already done something about?

Gianluca

In theory can be done like any other remote powered active antenna. However such modifications/rebuildings are quite labor intensive and no guarantee it will work as expected in the first place. Also please consider the followings:
1. Need to find sufficient rooms to put extra componets inside the tiny DE31 control unit as well as inside the DE1103.
2. Even if it can be done, such conversion may noticablly degrade the performance of the DE31.--- mutual interaction/coupling between extra components.

Will suggest install an external piggy back "Big"battery pack(2 D cells ?) to feed the DE31 rather than depending on the originally 2 tiny AAA batteries. ---- Such "made-do" resolution had long been used by TV professonals to operate their power hungry TV cameras.

Hope it helps.

702. Re: PK MW Loop Antenna cross post

Yahoo group: de1103
Date: 2006-10-13 00:12:05 UTC
From: Nash
Topic: 330 Message: 702

I have since purchased a PK AM loop antenna and I'm pleased with the performance. The construction is pretty robust, so it can withstand a fair bit of abuse, making it ideal for portable use.

I have a couple of favorite US AM stations (I live in Canada), and using this antenna makes them much clearer. The PK loop isn't a high end antenna by any means, but it does increase reception enough to make really weak stations listenable. It's cheap on batteries because it doesn't use any, and there are no wires. I keep mine parked beside my Tecsun BCL3000 on the kitchen table. :)

Topic: 703 Message: 703

Hey gang,

I was listening to the mets and cardinal baseball game on my Degen 1103 off my telescopic antenna after doing the 100khz programming. I was outside sitting on my balcony apartment. Signal S7-S9 3/4 to full scale 23:05 local Station WFAN 660 WNBC. Location here I live in Palm Beach Gardens Florida! Unbelievable..Listening to the am band with the telescopic and preamp trick works like a charm. If you go way out in the open area The loran stations besides am come booming in.! I miss those days listening to the yankee games on radio..the memories come back now. Holly Cow!

Okay well that is my first report.

Good job guys for the 100khz mod info. I think working off the telescopic has better signal to pick these big NY stations then the internal since we are utilizing the preamp.

Paul

From: Paul (Skywarn)
Topic: 705 Message: 705

Signal report..

10/12/2006 at 2305 WFAN 660 WNBC NY, am radio. Worked off the telescopic antenna ..100khz programming mod...Signal almost full scale. I live in Palm Beach Gardens Florida! Outside my balcony patio. What a radio report! Love this Dengen. Am works great! Listening to the radio station from NY brings back memories when I use to listen to the Yankee games..I miss the Yankee games on the radio NY Stations.

So I listen to a radio station over 1000 miles away wow!!I never had good enough pull in from these stations..before...also I heard 770 WABC a little bit weaker in the backgorund to some Fidel Castro intefering stations as well as WCBS 880 am radio tonite..signal S3 about 1/3 to 1/2 scale..weak but intelligible.

Loran works fabulous with telescopic..picked up loan stations I never picked up before even with DX390 radio..this is the best radio so far.. thanks for the 100khz program mod!..works better than the internal ferrite antenna!

Happy Monitoring

Paul

706. High Impedance antenna for outside connection.

Yahoo group: de1103
Date: 2006-10-13 23:55:10 UTC
From: Paul (Skywarn)
Topic: 706 Message: 706

Has anyone tried to install a vertical telescopic antenna outside for the degen and also use a certain rf shielded coax so you can get the maximum signal?

When I take my degen 1103 outside once I have performed the below 100khz program mod. The antenna on it works great and loran. Is there a way to connect to ant jack to a high impedance antenna. I believe an outside active antenna is what I need. Maybe, high impedance signal probe antenna

Any input to this topic?

Paul

Hello to all !
What about using alkaline batteries in my DE 1103 ? Yes, voltage could be slightly higher (6V vs. 4,8V) but it should be the same when using the AC adapter.
Any advice ? Thanks and 73 from Rik IZ2EJU

No problems, either may be used according to the manual. It's probably not a good idea to connect the charger with them inside, though.

710. DE31 Loop Antenna mod

Yahoo group: de1103
Date: 2006-10-14 13:15:55 UTC
From: Paul (Skywarn)
Topic: 710 Message: 710

Hello,

If anyone is interested in making the loop more tunable
in for only the lower bands 3-8.000 MHz. Just take the
4 screws off remove the loop wire antenna amplifier
(The part the wire loop goes into triangular shape.

There are 2 connections soldered one side of the wire
loop and the other. Just replace it with a longer wire
22 gauge small wire. I rigged my loop wire in a delta
shape and strung it outside my apt balcony. You
need to experiment the length of entire total delta loop
is 20-25 ft..The DE31 will tune best below 9 MHz to
at least 2 MHz..the longer the wire the lower it will go.

When you get back to the original length it will perform
the same as originally although a 22 gauge wire
will work better than the original..the telescopic antenna
and wire with it keep it in case you want to put it back
and solder original wire. You can easily take the original wire
of the loop and take it off the holes of the telescopic
antenna and replace it with a 22 gauge wire nice enough for
portable use. When done just wind it up..

You need to experiment. My interest is the low bands from
3 to 8 MHz..it will tune upwards you will hear increase
noise but not that peak tune up as with 3-8 MHz band.

Good luck.
Paul

Works great especially

711. Re: [de1103] DE31 Loop Antenna mod

Topic: 710 Message: 711

In addition...the signal comes in even better on the lower
bands and you still get gain higher up with full turn of the
tuner knob above 8mhz..but without the noteable peak
an dip of where you find may..anyway, its better
than before for the lower bands especially 80 meter
ham band..to listen.

715. De31 loop mod...replacing original loop with a delta loop.

Yahoo group: de1103
Date: 2006-10-16 23:58:18 UTC
From: Paul (Skywarn)
Topic: 715 Message: 715

I just used 8 foot for each section of delta loop.
there are 3 sections. I just completed mine and have
had good results! 80 meters tuning in good and booming!
it tunes down to almost 2 mhz and up thru 7.0 mhz.
ANything higher when you tune it you did hear increase in
signal but without the peak and dip effect. I am quite satisfied
since I was interested in the bands between 2 and 7 mhz most
interested mostly in 80 meters..3.5 to 4.0 mhz..

Experiment with the lengths. You have to monitor
to see signal performance. I used radio shack
grey shielded speaker wire. 16-22 gauge wire
is fine..same gauge as original loop.

Delta loop is a traingular loop look at the picture diagram. on this link.

I hope that makes it easier to understand what delta loop is..the feed to
the
bottom of the traingular loop antenna is off course where your amplifier of
the
de31.

bottom figure is triagular loop you will not transmit off it so dont worry
about using heavy duty wire..just use the thin stuff. The feet distance is
way too big for the amp in the diaggram use much shorter lengths like
8 feet each section or 4 feet first each section. Try longer lengths and
see what happens.. But for an apartment balcony 8 ft each section
was all I could do.

Delta loop is a traingular loop look at the picture diagram. on this link. I hope that makes it easier to understand what delta loop is..the feed to the bottom of the traingular loop antenna is off course where your amplifier
of
the de31 attached file is triagular loop you will not transmit off it so dont worry
about using heavy duty wire..just use the thin stuff. The feet distance is way too big for the amp in the diagram use much shorter lengths like 8 feet each section. Try longer lengths and see what happens.. But for an apartment balcony 8 ft each section was all I could do. On thing I noticed is that the 8 foot per section of the triangle antenna it tunes well in the 2 to 7 mhz band and even has some potential for lower tuning. It is possible longer length each section could bring some tuning down to the 160 meter band and upper am band

DE31 amplifier where loop connects on each side that is where you desolder the connnections on other side of the board here and use same thin gauge wire..
like what i used was a 24 feet of grey insulated speaker wire..16-22 gauge..

To all you Degen 1103 owners and the DE31
amp loop antenna owners.

After modifying the loop antenna to a triangle shape
and also attaching a random wire tapped on one
side of that loop. I am copying 180 meters.

1.843 MHz I'm listening to activity. SO I think
if you use longer lengths each side for triangle
antenna it does seem that the amp DE31
will tune lower down in the upper am band
more like 160 meter ham band.

So use longer than 8 feet each. The longer the
better..also nice cleaner signal. The intent here
is that the loop amp with original loop amplifies
more noise than signal. The larger the loop the
cleaner the signal..actually you are really amplifying
more of a better signal at the start than a more
noisier signal.

Take each side of the loop wire desolder from amplifier
which has 4 tiny Phillip screws. Need a jewelers screwdriver
set for that. In any case here are my 2 JPEG files..

Good Luck and let me know.. You may find it to switch to
local from DX mode. Reduce signal overload.

Paul

Topic: 707 Message: 720

I don't know if other users have noticed this or not -- when I used regular 1.5V alkaline batteries in my DE1103 or DE1107, the LCD display got darker and extra grey pixels became apparent. I noticed this when I used alkaline batteries while my NiMH batteries were in an external charger. When I put the NiMH batteries back in, the display returned to normal. I would venture a guess that these radios' power requirements are tuned to favor the lower voltage setting.

I had to return my DE1107 radio for warranty replacement because the LCD clock display quit working altogether. I wonder if the higher voltage from the alkaline batteries may have hastened the LCD failure. I have since purchased a few extra sets of NiMH batteries so I won't need to use the 1.5V batteries.

I'm using alkalines for my 1107 and haven't noticed any problems. I
just bought a battery charger and recharged the batteries I got with
my old 1103 that I was using in the 1107 that didn't appear to hold a
charge for very long, using the charger in the 1107. One of the
batteries fully charged almost immediately, two took about an hour,
and the other about an hour and a half. I'm using the MH-C401FS
charger from Thomas Distributors. By the way, has Kaito changed its
address? I sent my warranty cards in several weeks ago and just got
them returned with the address unkown thing stuck to the face.

Just for your info:
In Germany an active loop antenna named DE31A is sold.
It covers the range from 1.8-4.5MHz and from 3,6-22 MHz.
Look at http://www.thiecom.de/shop1/index.html
and search for "DE31A". The price, however, is unaccaptable.
I was wondering, wheter the original DE31 is modified by the seller or
whether this is new model. I searched for DE31A, however, I only found
thiecom.
Would be nice if it could be bought directly in China.

Hi
Just joined the group as I will be receiving a new 1103 at the end of the week. I've been using my Sony 7600GR for about a yrear now and really enjoy it. I saw so many reviews about the 1103 and its newer and more expensive cousin the Eton5 and decised to pick up the Kaito for $80. Does anyone here own both radios? Can you tell me where I might be seeing and hearing the 1103 shine over the 7600? And- can I use the Sony Alp-1 Active Antenna with the 1103?
Thanks,
Tom

I've got the both the 7600G and the 1103. Here's my answers to your questions:

-The Sony is a better radio, especially in conjunction with the AN-LP1. Slightly more sensisitive and definitely a little more selective with the use of sync. Ergonomics also go to the 7600G for ease of volume adjustment, USB/LSB resolution and memories.
-Having said that, the 1103 is a very impressive little radio. Off just the whip it slaughters the 7600G on sensitivity. Carried to a suitable location with low RFI, it is downright unbelievable. It also has a very low noise floor, compared to high background noise with my 7600G.
-My 1103 has worked fine with the Sony ANLP1. The cheap DE-31 loop may even work better. 15 feet of external wire out the window is fine. Like I also said, it shines off the whip.
-If you can pick it up cheaply, you may also be impressed by the Eton E10. No SSB, but very sensitive and works great with either the ANLP1 or the DE31.

Enjoy,

Mike

Hi,

I have both DE1103 and Sony 7600G (i.e. not GR, but the
older version). I think the performance of these radios
is very close to each other. DE1103 may be slightly more
sensitive on SW bands, despite the fact that Sony 7600G
already is very sensitive. I also like the possibility to
switch between the narrower/wider filters on 1103.
While listening SSB signals, I've found tuning method
of 1103 somewhat awkward, but when you've find the right spot the SSB signal is very clear
in both radios. Sony has the AM Sync feature, which may be helpful in certain conditions.

The usability of Sony 7600G is much better, but when you
get used to the much discussed oddities of 1103's user
interface, I think you can live with it.

After all I have been very happy with both radios and really
surprised of 1103's performance considering the price, ~60 EUR versus over 150 EUR for
Sony.

Yes, I am leaving this group because I am not a De1103 owner anymore. I have had it for 10 months and have enjoyed it a lot, but I simply found that the Sangean 909 is really better. The only things that I miss from the DE1103 are its small size, almost pocketable, and the BFO. With the 909, to tune SSB, you have to switch the encoder mode from 'fast' to 'slow' and this is slightly more awkward than with the Degen. Audio quality, saturation, image rejection are better with the Sangean. Sensitivity is similar. Well, enough said. Have a good listening, folks.

Hey Fabrizio,

Sounds like you got tired of the radio.. Why use it for 10 months then get rid of it. My Degen 1103 works fine, I think the comments to how one radio works to another is left to the owner to interpretartion. One can not speak for us all. Sometimes we get use to our ways and features we like to use. As far as I am concerned my Degen 1103 works well.. My only suggestion is get a preselector with an attenuator on the antenna tuner.. like the FRT-7700 ATU or similar feature. In any case I found that my degen 1103 has out peformed the Dx398 by a long shot.

It is a big difference when you use late 90's technology and circuitry as opposed to more newer SMD type circuits with high Q coil circuits in the latest ciruits for the shortwave and broadcast band. That is what is in the Degen 1103 schematics...that is why for such a small radio the SSB works well and is stable. I receive wefax and no drift whatsoever.

Paul.

Hi Guys,

Well. I just got my Degen and I have to say after an hour of use that I am very impressed and very happy with it. I noticed right away its little quirky volume method- I really like that. What makes me laugh is all the reviews I read that made such a big deal out of this as though it were some major inconvenience. I nearly bought the Eton 5 for nearly twice the price to avoid this. Glad my sense of thriftiness ruled this time around. Great radio! I'll probably use this for awhile- go back to the 7600GR- and then comeback to this again. The beauty of diversity.

From: Pete Nalda
Topic: 734 Message: 734

Well, I know I'm a glutton for gadgets, but am curious to see what others observations are of this radio. From what I've read on the 'net so far, it seems like Degen/Kaito are the makers of this unit and It's supposedly a KA1106. Like our 1103, it has a tuning knob, and is about the same size as our 1103 as well. I have read reviews of the eton e5, which this is a close relative, and they're saying the 1103 is more sensitive. What I was liking about it was the telephone keypad layout, the black matte finish, and because there's no analog dial, the frequency readout is much bigger. plus it has a whopping 700 memories over the 1103's 256. I'd really be curious to how well it stacks up to the 1102, since I was considering one of those a while back, but never did take action on. It's not as good as value though that's for sure at $149, and that doesn't include rechargeable batteries. If you google for grundig g5, there isn't much online yet, but there is on the e5 over at eham.net.

Opinions?? TIA.

Topic: 731 Message: 736

Hi Paul, thanks for replying to my message. I'll try to explain my views a little more in detail now.

> Sounds like you got tired of the radio.. Why use it for 10 months then get rid of it.

Well, the only reason why I decided not to use the Degen anymore is merely that I am enjoying the Sangean more. The reception is more pleasant, at least for the kind of listening that I'm after, that is, listening outdoor to SSB ham bands from 7 Mhz up to 28 Mhz, using a wire antenna. One of things that I disliked with the Degen was poor image rejection, especially when listening to 14 Mhz ham band and having images from 900 Khz higher. The Sangean is not affectd by these images and its AGC reacts very well to prevent front-end saturation.

Maybe for other uses, like perhaps listening to BC stations in the low-medium range of SW with the rod antenna, the Degen could turn out to be a better receiver. As for the 10 months time, I don't like to change too often radioes, or other stuff in general. Once I'm happy with something, I will stick with it for years.

> My Degen 1103 works fine, I think the comments to how one radio works to another
> is left to the owner to interpretartion. One can not speak for us all. Sometimes we
> get use to our ways and features we like to use.

Sure! Everyone has his own opinion. I'm NOT telling everyone that the Degen is a bad and useless receiver and they must change their radioes just because I did.
But if it wasn't for reading other people's opinions, I would have never known anything about both the Degen and the Sangean, and this time I want to 'return the favour' by telling other people my own opinion.

> As far as I am concerned my
> Degen 1103 works well.. My only suggestion is get a preselector with an attenuator
> on the antenna tuner.. like the FRT-7700 ATU or similar feature. In any case
> I found that my degen 1103 has out peformed the Dx398 by a long shot.

The preselector/attenuator/tuner is a good idea, but I use these portable radios outdoor, standing up and holding them in my hands and a preselector would be fine if you use the Degen as a home receiver

on a table. And a preselector would not solve the audio quality issues. I found that the Degen SSB doesn't sound as crisp or clean as the Sangean's. SSB on the Degen has audio distortion from 20 Mhz up and it gets worse as the frequency is higher.

I heard that the Dx398 is a Sangean clone. Do they work the same? I too read some not so good reviews of the Sangean. Maybe it has been improved during the years... Even the Degen has been produced with improvements and modifications since 2004.

The Sangean's SSB is stable too. I cannot comment on circuitry and I believe that what you say is true in general, but the fact is that the Sangean works better for me.

Thanks Igor! I find that sound is more distorted on 28 and 24 Mhz,
(well, there is not much activity there on these low sun spots days)
while on 21 Mhz the distortion is not so strong.

It seems, once again, that not all DE1103 behave in the same way.
Thanks

Did u tried to identify if it is the radio rather than other factors (i.e. propagations problems/transmitter stability/time of the day/weather ...)of the signals ? The 24 -28Mhz bands can behave quite different than other lower freq. bands. In some extreme cases, an airplane passing through their propagation paths can change the signals "finger prints" noticeably --- A way to reveal stealth fighters' presents?

Well, I am sure it depends on the radio. I have experienced this problem long enough.. I even heard the same stations on different frequencies and they were distorted only in the high bands.
It's just audio distortion. Yes, it's strange that it depends on the frequency being tuned. The lower bands (below 20 Mhz) have much less distortion. The problem is only in SSB mode...

Fab

Sure the DE1103 can be bad to begin with, yet wonder if it happened only in the SSB mode. The SSB is always operated on the fixed IF freq. and so does the audio output from the same detector. In short if the SSB mode is bad the problem(s) will exist in all other bands and not limitted to these "High" bands. More over cannot rule out if those mysterious stations were not SSB station at all.(e.g. distorted stray signals from powerful AM stations) Again even it was the same broadcaster, different transmitters, propagation conditions, transmission locations (including different oversea relay transmitting sites)... could affect the reception quality completely different. Did u tried other radio(s) and note the difference?

742. Randomwire antenna impedance matching: my own experience

Yahoo group: de1103
Date: 2006-11-07 22:30:54 UTC
From: Horacio Nigro
Topic: 731 Message: 742

First of all I want to say that I am very happy with my Degen 1103. Had some problems after first period of using it, with the antenna matching and overloading.

I have a 25 meter randomwire, which is too much to this one and my other receiver, a Kenwood R600 (right now under service due to PLL disengagement).

So, when the Kenwood arrived to my hands, I have the need to use a coax cable down to the receiver to overcome the RFI problems (TV, Computers, cable TV, local TV sets, neighbour's electrical generated noise, fluorescent gas filled lamps.... uff..). Improved the height of the wire, to about 6 meter in the nearest to the rx end to 3 at the end. But it was not enough. There was a complete impedance mismatching. I partially solved this with a home made magnetic longwire balun (a ferrite toroidal ring with the corresponding turns of wire). It solved my problems of overloading on the shortwaves range. But not in the MW part of the spectrum, hence I used the provided RF attenuator switch of the Kenwood R600 to have usable reception.

When the Degen was inaugurated at my listening post, the antenna and the MLB was still giving too much signal.
After some try, I decided to wind 13 turns of insulated wire on a ferrite bar and another piece of wire in one end of the coil, 6 turns, which were connected to the receiver.

This was the solution and now I have nice reception in all bands.

RF Noise (QRN) is still a problem in some parts of the Tropical bands (90m, some portion of the 60m). But things improved...

Those stations were not 'mysterious' :)
They were amateurs (hams, OM) transmitting in their own bands, not AM
stations.

> Did u tried other radio(s) and note the difference?

Sure. On my ICOM R10 and Sangean 909 the SSB audio is crystal clear on
all bands.

Sounded like you got RF parasitic oscillations on those problematical bands. Check any telltale loosen groundings, cold soldering joins, bad components ... otherwise put extra shieldings inside the radio may help.(please see the files section of this forum and check "Degen_de_1103 modifications.zip") Hope we can solve the mysteries now.

Yes, this makes sense, but I won't bother doing this, because I have already sold the DE1103 to a friend who is only interested in FM reception and with this radio he is finally able to receive a certain station in the very crowded FM band here in Rome. Anyway, thank you for your efforts in trying to help me!

Then, I am not very good at opening radios and soldering. :) I just have too little experience in this.

Then again, like I said before, this was not the only area where MY De1103's performance was not as good as my new Sangean. It is possible that I had a faulty, defective DE1103. I have not tried other DE1103's though.

I will keep a good memory of this little receiver. It has amazed me many times with its great reception and made me picking up again this hobby after many years.

747. Storing staions to memory on the Kaito1103

Yahoo group: de1103
Date: 2006-11-09 14:19:56 UTC
From: epsilon2675
Topic: 747 Message: 747

Hi,

I'm a little confused about 'hidden' storing on the radio functions. It seems that when I try to store stations after 1 thru 11- well, somewhere around there, the memory codes change to a1 a2.. b1 b2.. etc. I thn store the station but don't see it again. What am I doing wrong?
Thanks,
Tom

After storing frequencies into your chosen locations, push the "mem" button once, then use the jog (tuning) knob to scroll through memory.

750. Possible cause of some problems: corruption from undervoltage?

Yahoo group: de1103
Date: 2006-11-10 14:55:08 UTC
From: Dave Spicer
Topic: 750 Message: 750

Just joined the group - my KA1103 arrived yesterday. Began listening to shortwave in the early 1960s with a BC-454 (WWII surplus aircraft receiver), my interest has returned in recent years. Radios have sure evolved!

There has been discussion of problems requiring the batteries to be removed for a few days to allow a kind of "reset". This seems similar to an issue with an older mp3 player I have - a RioOne. In that device, battery exhaustion while playing sometimes results in firmware corruption. The only remedy is to reload the firmware. Perhaps some type of temporary storage in the -1103s gets corrupted under similar conditions, and is only reinitialized from a completely "cold start"?

Of course this is just speculation, and I wouldn't be surprised if it was completely inaccurate and useless. Wouldn't be the first time for me, won't be the last... :-)

hi all,

Has anyone of you here own the Emerson 10-band radio available at Sears.com? It's the one with a rotating AM Ferrite antenna and a big handle bar in the front. It can also be used as a Public Address system since it comes equipped with a mic In and a mic.

What can you say about its overall performance. How sensitive is it on the bands? Does the airband (which is actually incorporated on the FM band hence WFM receive instead of AM mode) works ok? I'm planning to get one as it looks like a fine radio.

754. Just got my Kaito KA11--it's no DE1103

Yahoo group: de1103
Date: 2006-11-11 17:17:38 UTC
From: mr__simon
Topic: 754 Message: 754

I bought the new Kaito KA11 from Radios4You on ebay for $52.95 + shipping, and I've had it for a couple days now. There was some speculation that it might be a DE1103/Grundig G5 in a smaller travel size package. I can tell you it is definitely not up to the standards of the DE1103, but it's not a bad radio. If you are looking for something very small, comparable to the discontinued Sony ICF-SW100S or SW1S (one of my all time favorites) it's a good deal.

Pros: Small size, double conversion, built-in battery charger, built-in thermometer (!?), travel lock disables all functions including back light, 1000 memories spread over ten "pages", memories are non-volatile so changing batteries doesn't affect them (changing the batteries does reset the clock though), sensitivity on par to KA1101, works reasonably well with the DE31 antenna

Cons: no travel pouch or batteries included. Operation can be confusing and the manual is poorly written. Sometimes the thermometer displays in Fahrenheit and sometimes in Celsius and I can't figure out why--the manual says nothing; restricted frequency range 5.8 to 18.1 MHz; Handling the radio greatly effects reception, poor dynamic range--the DE31 antenna can cause overloading; quality seems a bit suspect, the "8" and "0" buttons stopped working, but removing the batteries fixed it. I prefer a travel lock switch on the side of the radio, rather than the "press and hold" lock on the front of the KA11.

So while I like mine, I'd say it's only worth looking at if you want something very small for traveling.

Hi all,
I have been experiencing some weird qrm on the am bands for quite some time now. It appears at several different places. Just thought I'd post it in case anyone elses is also experiencing the problem. My short video, taken w/ my RP2100 tuned to 710khz, should describe the situation. It appears at other freqs as well.

BTW, I am also a happy de1103 owner. I post the pix of the other radio just because that's the one I was listening to at the time.

If I can post the video, please check it out and I'll be checking back in.
Thanks, Riley.

This is my thinking as well. I should mention that I live in a rural area, and that should be the only local source of noises, outside of my computer equipment. Perhaps there is some experimentation going on with BPL (broadband over power lines), but this stuff does not sound like the bpl recordings I've heard on the net. Neither does it sound like the normal power line pulse noise.

I am also suspecting some new military equipment possibly at the Parris Island base in Beaufort(approx. 60 mi. from my qth).

It is strange, and just wondered if anyone else has heard it. Later, Riley.

Hey, Well, it's 7:30pm now, and it's still there...at the same frequencies. I have noted it at 710 and 1570khz. These are the strongest signals. Has been dark for nearly 2 hrs. and the band is wide open, but it's coming in on top of the stations.

I have heard it on all my radios, including the rp2100, de1103, and a GE superadio. Plugged into the ac or not makes no difference.

I am an amateur operator and am familiar w/ teletype and digitl modes such as psk31 and mfsk16, etc., but I cannot identify this particular signal. It is obviously man-made, and not an atmospheric disturbance, in my humble opinion, anyway.

Maybe, if it's a locally generated signal, some of you can hear it also, now that the band is open. May be worth a listen.

Later, Riley.

Sounds like the Marines have a new gadget. Anyone know if 5950 Taiwan is being jammed by China via Cuba? Interesting

Subject: [de1103] Re: Some strange interference on the AM band

Hey, Well, it's 7:30pm now, and it's still there...at the same
frequencies. I have noted it at 710 and 1570khz. These are the
strongest signals. Has been dark for nearly 2 hrs. and the band is
wide open, but it's coming in on top of the stations.

I have heard it on all my radios, including the rp2100, de1103, and a
GE superadio. Plugged into the ac or not makes no difference.

I am an amateur operator and am familiar w/ teletype and digitl modes
such as psk31 and mfsk16, etc., but I cannot identify this particular
signal. It is obviously man-made, and not an atmospheric disturbance,
in my humble opinion, anyway.

Maybe, if it's a locally generated signal, some of you can hear it
also, now that the band is open. May be worth a listen.

Later, Riley.

Paul, What is your qth? I am nr Charleston, SC.
Also wonder if you can hear it during the day, or just at night. Not that it really matters...consensus seems to be either Chinese transmitters located in Cuba or military apparatus of some sort!

In either case...hmm...oh well!

Don't guess it would be beyond the realm of possibility to pick it up from Cuba via ground wave here in the daytime.

In reference to the later post, yes it would definitely be more pronounced if you turned on the ssb detector.
Later, riley ars wd4dkv

what station(s) ---- on 710 and 1570 Khz ---- subjected to be jammed?
Is the jamming existed all the time 24 hours a day?

My QTH is Palm beach Gardens Florida

about 11 miles NNE of PBIA airport. correction I hear the jammer on 1550 khz
not 1570 sorry... There seems to be a Cuban station there..

woo woo woo woo woo

Okay folks,,

Here is a short mp3 recording of the jamming on 1550 khz.

I think the cuban station is in south miami the radio free
cuba radio station and Fidel and his chinese friends have been sending
this jamming signal for some days now....loudest after dark.
You may have heard about this station from time to time on the news
when they talk about cuba and the miami cubans who support this station.

I had to record it over for a smaller file since the last one
kicked back as too big of a file

Paul

Yet Charleston, SC is seemingly to far away from Cuba yet still pick
up the jamming signals up during daytimes (via ground wave ?).
Sounded strange.
On the other hand, did the jamming stopped when the "Target Miami
station" sign off? Nevertheless if jamming(s) lasting through an
entire day without interruption, cannot rule out it can be sorts of
airport navigation systems/beacons transmitting at the same freq (but
different locations) as part of a network.

From: mdovell@adelphia.net
Topic: 755 Message: 772

It could be a repercussion from the HD radio...there's been talk that the HD radio AM stations cause problems in adjacent channels during the day. If you go to hdradio.com you can see what am stations would be in your area. Basically find a station on that site and go 10khz up or down and if there's noise that could be it...

773. Re: Storing staions to memory on the Kaito1103

Yahoo group: de1103
Date: 2006-11-15 15:38:30 UTC
From: Steve Payne
Topic: 747 Message: 773

Tom, I remember about a year and a half ago, when I first got the 1103 (mine is a Kaito), it took me a while to get used to the thing, especially memory locations. But, I love this radio. Besides it great performance, its unusual user interface characteristics make it more fun to use.

Here are a few big ideas to keep in mind about the 1103's memory storage.

1. Idea One: The memory locations are numbered using the Hexadecimal Numbering System (e.g., 0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F). It's easier for me if I think about the storage locations in the following groupings:

00-0F (00-09 are visible memory locations; 0A-0F are hidden)
10-1F (10-19 are visible; 1A-1F are hidden)
20-2F (20-29 are visible; 2A-2F are hidden)
30-3F (30-39 are visible; 3A-3F are hidden)
40-4F (40-49 are visible; 4A-4F are hidden)
50-5F etc.
60-6F etc.
70-7F etc.
80-8F etc.
90-9F etc.
A0-AF all memory locations are hidden
B0-BF all memory locations are hidden
C0-CF all memory locations are hidden
D0-DF all memory locations are hidden
E0-EF all memory locations are hidden
F0-FE all memory locations are hidden

2. Idea Two: The difference between Visible memory locations and Hidden memory locations: Visible locations are those that are "all" numeral (e.g., 01,23,34,45,55,67,99). Hidden locations are those with "alpha" characters (e.g., 1A,3E,3D,4B,6F,AA,BA,BD,ED,F1,A3). Any frequencies/stations you enter into the Visible locations can be easily "keyed" into the key pad for direct access (i.e., Enter "10" followed by "M/F" button, and the radio will go to whatever frequency/station you stored in memory 10).

3. Idea Three: Although direct entry of memory locations with the key pad can only be done with Visible locations, jogging through the memory banks with the jog dial wheel while M/F is in MEM mode shows ALL memory locations (visible and hidden) that have frequencies/stations stored in them. Keep in mind that when jogging through the memories in MEM mode, you will only see memory locations

that have something stored in them. It skips all locations that are
blank.

I hope these thoughts help a little.

774. Looking to get a replacement

Yahoo group: de1103
Date: 2006-11-20 03:19:22 UTC
From: war4prez2002
Topic: 774 Message: 774

Should I get simply a new 1103 or wait for a newer one? I have heard of one that 1121 can record on mp3's and also has Wx (not that big of a thing but nice)

I sort of kinda fixed mine but it still isn't right. the jog wheel is better but it screwed up the antenna (it isn't fully tight and I can't find screws small enough for it..)

775. Pellican Micro Case For Degen Radio

Yahoo group: de1103
Date: 2006-11-20 21:49:49 UTC
From: Nash
Topic: 775 Message: 775

Just received my Pellican 1060 Micro Case from L.L. Bean. Fits both my DE1103 and DE1107 radios like a glove. Perfect!

I live in Canada, and I qualified to get free shipping (limited time), and no duty, just the sales tax was extra. WOW. There was only one other place in my town where I could get this case (Mountain Equipment Co-op), but it was more expensive, and it was a crappy color. I got the clear case with the yellow rubber liner.

They also have a nifty color Eton for sale:

http://tinyurl.com/9f89w

Ahh, but I'm over my radio budget. Oh well.

For the price and performance, you can't beat another 1103. But, I just took the plunge today and ordered a new Grundig G5 (as if I need yet another radio). It's the very same as the Eton E5, and, except for the newly designed user interface, is the very same radio as the Degen/Kaito 1103. I just knew that Eton would eventually succumb and rebrand the E5 as a Grundig. I fell for it (unashamedly so) and couldn't resist. One big consideration: It's price is $150 or so, rather than the 1103's 60-80 bucks.

I'd be curious to know how it performs compared to the 1103, I'm
attracted to the g5 because of it's bigger frequency readout, as
well as the numeric keypad.

I'll be sure to post a review when I get the G5 and compare it to my 1103. I am hopeful. You may have already done so, but if not, take a look at the RadioIntel review of the Eton E5 (same radio). Here's a link to that review: http://www.radiointel.com/review-etone5.htm. Check out eHam.net's review of the Eton E5 as well.

780. Erasing memories

Yahoo group: de1103
Date: 2006-11-23 12:18:25 UTC
From: radiofanuy
Topic: 780 Message: 780

Hi,
I am new in this group. I received my DE1103 about 10 days ago right from the manufacturer's office in HK. I am quite satisfied with the performance of the receiver. In terms of SW sensitivity I find it roughly equal to my old Sony ICF-7600DS. On FM of course it's far better than any other receiver I own.

My question is, is it possible to erase a given memory position without entering a new frequency? I guess than resetting the unit will do the trick, but I would like to erase just one or a few of the memories.

73,
Moises

Thank you Pete! In fact the attachment in your message was filtered by the server, but anyhow you called my attention to the user's manual. It's so obvious... just that the Manual is so ... humble that I forgot about its existence!

I also learned that resetting the unit won't erase the memories, unless you press three more keys simultaneously.

Thanks again!

Moises

784. Degen 1103 Receiver and Frt-7700 tuner

Yahoo group: de1103
Date: 2006-11-26 12:34:16 UTC
From: Paul (Bladerunner)
Topic: 784 Message: 784

Hey gang,

Love my degen 1103 receiver even now more than ever. I picked on ebay up a yaseu frt-7700 preselector tuner. It has a filter for low band harmonics filtering and tunes real nice on random wires especially those from 35-50 ft..even for am band..in any case if you get a chance search on ebay and keep tabs on one to bid..it also has a built in attenuator up to 50db attenuation!

If you are getting AM distortion on all signals your radio might be faulty.

Using SSB to demodulate AM used to be popular a long time ago as it gave
more sensitivity, it was called exhalted-carrier detection; something like
synchronous detection without the phase-locking.

Leon

Topic: 785 Message: 787

What you are doing is called Exalted Carrier Selectable Sideband tuning (most often referred to as ECSS). Indeed its use came from the early days of radio reception, but it is still widely used by serious short wave listeners. It can help eliminate what is called selective fading distortion. It also allows you to select the sideband signal with the least amount of interference. Because many radios use narrower filters for SSB, often you can use this method to separate out stations closely spaced or even on the same frequency. Many prefer its use (particularly with radios that have passband tuning) to the use of AM Synchronous Detection that is found in many high end receivers.

In any case, you have figured out how to use the capabilities of your radio in a way that can help you dig out some of those more difficult signals. Congratulations!!

Phil P.

Owing to limitted case space (The radio size --- Speaker enclosures) it is easier said than done! Use the line outputs of the radio and hook up to a decent stereo amplifier (with top-of-the-lines speaker pairs !) may fulfill your requirement. Unfortunately the shortwave tuned IF band pass width may still fail to meet your expectations. Hope it helps.

I have both receivers. The 1103 is far more sensitive, particularly off just the whip. The 398 does a better job of handling real external antennas and really shines when being used to demodulate USB or LSB. The 1103's SSB demodulation isn't one of the real strengths of the radio. Still, I end up using the 1103 much more.

Mike Bryant

There are many amplifier/speaker combos designed for use with iPods and the like - the ones which also accommodate other mp3 players will have the correct plug for connecting the DE1103. I haven't tried this myself, so I can't say whether the impedance and output level would be suitable... try before you buy :-)

Hello,
I found another idea in a German magazine (Funkamateur, 2/06
www.funkamateur.de). The author tested the original DE31 and found
that the antenna only showed a noticable gain above 9MHz. At 5MHz
there is not much differece to the built-in antenna.
To be able to tune also between 2MHz and 7MHz he added inductivities
to the loop (for frequencies between 2 and 5 MHz a Amidon T130-2 with
45 windings of a 0.6 mm copper wire is used for the rabge 5 to 15MHz
an T106-6 core with 13 windings was used, de-solder the loop at the
amplifier, find which connection is ground (low resistance between
this point and ground of the the plug), and the coil into the hot part)
I bought three DE31 directly in China. Two of them were modified
acoordingly. One was left in the original state. Now I can change the
bands plugging the appropriate antenna to the control unit. One could
also add a switch at the inductivities and use only one DE31. However
that would mean leaving the chair to change the band.
cheers
Kurt-Erich

796. Preselector for DE1103

I uploaded the drawing to >Files (Simple_Preselector)
The inductivity should be 5muH for 3-10MHz or 0.6muH for 9-30MHz.
The fat line in the drawing means a connection to the frame of the
variable condensator.

803. Re: tuning AM on ssb

Yahoo group: de1103
Date: 2006-12-07 04:48:28 UTC
From: Tom Holden VE3MEO
Topic: 785 Message: 803

It's EC alright but the filter and BFO offset are not adequate (at least not on my receiver) to describe it as ECSS. My BFO (Fine Tuning) can offset up to about 1.5kHz so the max main tuning offset is 1kHz, given that is the size of the tuning steps. The filter is at least 4kHz wide at -6dB with a wide skirt so the offset should be about 2.5 kHz for reasonable suppression of the unwanted sideband. With 1kHz main tuning steps, 2kHz or 3kHz are the closest offsets but you'd need a much coarser 'Fine Tuning' control for that range, making zero beat very hard to find. But NEO says he tuned 2kHz high so maybe manufacturing tolerances or a production change has resulted in some capable of a 2kHz offset.

I first commented on this in the old group at http://groups.yahoo.com/group/kaito-de1103/message/1421 .

804. Extended BFO range?

Yahoo group: de1103
Date: 2006-12-08 04:43:17 UTC
From: Tom Holden VE3MEO
Topic: 804 Message: 804

Here's a question for the technical literati...

Has anybody got a mod to extend the range of the BFO. On my 1103, I think it's approx +/-1.5kHz. I'd like it to be at least +/-2kHz, maybe even +/-3kHz, for better sideband suppression when receiving SSB signals or for exalted carrier AM detection. Trouble is, the FINE control might be too coarse for easy zero-beat.

According to the Russian review by Iris, the narrow filter's measured -3dB bandwidth was -2.2 to +2.6kHz, 4.8kHz in total. Ideally, for both SSB and ECSS, the carrier frequency should be down the slope of the skirt by 12 to 20 dB. That suggests a BFO offset from the i.f. of +/-3kHz is needed because the radio tunes in integer steps of 1kHz. An offset of +/-2kHz would not suppress the carrier frequency at zero beat by more than a couple dB while +/-4kHz is likely excessive (>20dB by interpolating to the Iris' reported -60dB bandwidth of -7.5/+8 kHz).

Looking at the schematic, Q19 is the BFO transistor whose oscillating frequency is determined by the 456kHz ceramic resonator U8 and surrounding capacitances. VD2 is a dual varactor diode biased via the FINE control W701 to provide a variable capacitance in series with the resonator to ground. The IF is 450kHz so, in my radio, the highest BFO frequency must be about 451.5kHz and the lowest 448.5kHz, given the observed +/-1.5kHz offset. I want to push it to 453/447kHz. On my DX-394 with a similar bandwidth SSB filter, the offsets from 455kHz are +/-3.5 kHz in order to get reasonable sideband suppression.

The lowest frequency should occur when VD2 is at maximum capacitance (the FINE wiper is closest to ground) and highest at its minimum capacitance (wiper closest to the voltage coming from IC7, whatever it is.

The range might be extended above 451.5 kHz if we could supply W701 with a higher voltage but that would do nothing for the lower stop; is there a higher voltage available? Removal or reduction of 100p C706 might also lift both limits, the higher moreso than the lower, as it parallels VD2.

447kHz might be more than a 456kHz resonator can be stably pulled. Probably, increasing the series combo of 103p C704 and 102p C705 that parallel VD2 would pull it lower (unfortunately on both limits) but they also are part of the feedback network and that could affect output level. What are these values 102p and 103p - are they so critical that a 1p difference is significant?

Maybe the requirements for the two extended limits are contradictory and they cannot be met without switching some elements, e.g., two ceramic resonators. If switching was voltage sensitive, maybe it could be triggered by the FINE control so that half of its range tuned around 447kHz and the other half tuned around 453kHz. The DX-394 uses separate ceramic resonators for the two BFO frequencies but with no operator control to vary them.

Is this too complicated and power and space hungry to be feasible?

Hello to all.
I recently noticed that on a cold day the tuning system of ka1103 is all messed up. when I try to tune using the tuning wheel the display will show frequencies going from low to high even when I scroll to lower frequencies. After the radio has been on for a while (30-40min) it begins to operate normaly.
Any comments on how to fix this problem are appreciated.

Thank you all,
Leon

That's a lot of capability for the price - $79.90 vs $49.90 for the DE1103. It's sort of a DE1103 with a docking MP3 recorder/player and then some! Computer loadable frequency memories, LW and Weather bands, 1 & 5 kHz steps on SW, a third attenuator setting and powered speaker for external sources are obvious extras. Missing is coverage of the upper MW 1.7-3 MHz.

Looks like the LCD screen of the MP3 module is shared with the radio but literature says the radio and MP3 can work independently.

Time for somebody to start a KA1121 / DE1121 group!

I plan on getting the C version and maybe the Kaito later on. Pretty cool radio.....

Subject: [de1103] Re: Fw: Kaito 1121 appears on kaitousa.com

That's a lot of capability for the price - $79.90 vs $49.90 for the DE1103. It's sort of a DE1103 with a docking MP3 recorder/player and then some! Computer loadable frequency memories, LW and Weather bands, 1 & 5 kHz steps on SW, a third attenuator setting and powered speaker for external sources are obvious extras. Missing is coverage of the upper MW 1.7-3 MHz.

Looks like the LCD screen of the MP3 module is shared with the radio but literature says the radio and MP3 can work independently.

Time for somebody to start a KA1121 / DE1121 group!

73, Tom VE3MEO

I was thinking of getting another 1103 but if this comes out at $79 well I'd definatly get it. It looks like ebay might have pulled that listing already though. Weatherbands are OK but the mp3 recorder alone would be good enough.

I wonder if you could combine it with the alarm...in other words make it like a tivo or time tracker for radio...there's plenty of content on air when I'm asleep or at work....

I can do it with video with a pvr with ease...radio just seems like...well...this could be a good start.

No, I count 26 currently available on ebay, all from seller tquchina, plus US$24 shipping.

Joshua says weatherband not included on model from China but is on the Kaito model for North America.

The European model from Thieking and Koch has something different, too, I believe:
http://www.thiecom.de/thieking/de1121/index.htm in German
English translation:
http://translate.google.com/translate?u=http%3A%2F%2Fwww.thiecom.de%2Fthieking%2Fde1121%2Findex.htm&langpair=de%7Cen&hl=en&ie=UTF-8&oe=UTF-8&prev=%2Flanguage_tools
Most obvious is no gap coverage from 50kHz to 30MHz.

>
> I wonder if you could combine it with the alarm...in other words make

Clear indication of that on the thiecom site but limited to three alarms.

816. Re: Fw: Kaito 1121 appears on kaitousa.com

Yahoo group: de1103

From: Tom Holden VE3MEO
Topic: 806 Message: 816

Hmmm - quite the spread...

Degen DE1121 China model from tquchina ebay seller: US$79.90 + $24 shipping to Canada
Kaito KA1121 US model: US$$199.99 + shipping
Thieking DE1121 Europe model: Euro219,00 + shipping (~US$$290)

What are the differences? According to adverts:

Frequencies:
China model:
FM: 70.0MHz - 108.0MHz (step is 50KHz/100KHz)
MW & LW: 150KHz - 1640KHz (step is 1KHz/9KHz)
SW: 3000KHz - 29999KHz (step is 1KHz/5KHz)

US model:
1. AM: 140 Khz -520Khz (Long Wave), 520 KHz- 1710Khz (MW)
2. FM Stereo: 70Mhz- 88.0Mhz (Low FM), 88.00Mhz - 108 MHz(Upper FM)
3. SW: 3000 KHz - 29,999 KHz
6. NOAA Weather Band : Channel 1 - Channel 7.

German model:
Long wave: 50 kHz - 521 kHz!
Medium wave: 522 - 1719 kHz
Short wave: 1700 kHz - 29.999 MHz
UKW: 70 - 108 MHz
menus in German

The models are likely identical hardware with different firmware versions so I wonder if the China model can be:
a) tuned by keypad into the extended LW, MW, SW and NOAA ranges of the others
b) firmware upgraded by the software for one of the other models (eg - the thiecom site has their software)

I hope this isn't going to be a soliloquy... Anybody?

Noticed that 1 of the back-back varactor diodes VD2 does not have a
dc path to ground so I wonder if it is even varying in capacitance.
If effectively unbiased and at maximum capacitance, regardless, maybe
something could be done with it for extended range.

Apparently this is getting a bit confusing because I was searching under kaito and degen to nothing found. typed in 1121 and this didn't come up. It must be the way how ebay does their searches. Needless to say however there's a HUGE difference in price (3x if not more) between the german one and the chinese one...

820. Degen and mini whip antenna?

Yahoo group: de1103
Date: 2006-12-10 10:41:59 UTC
From: Jara
Topic: 820 Message: 820

Hi all,

I tested my Degen with mini whip antenna (but my antenna use 30cm long rod, not only PCB as original).

Antenna work very good and is better than longwire 20-40m long especially for band 20-400kHz and for 80meter HAM band!

Best regards, Jara Rat

Jara,

I have the mfj 10 ft adjustable telescopic antenna. It has a 3/8 base threading connection. Did you use the ground with this or not? What did you use for a feedline or connection to vertical antenna out side.?

822. Preamp FET and FM filter replacement

Yahoo group: de1103
Date: 2006-12-10 23:37:09 UTC
From: Horacio Nigro
Topic: 822 Message: 822

The FET preamp problem

It's time to open the receiver for the first time, since it appears that the front end FET (the YJ from the preamp) has blown. I get reception with diminished sensitivity after a lightining storm some time ago, using a longwire. The lightnings were no very near but one of them was enough to produce the problem.

Nevertheless, the receiver didn't get silent at all on SW (the other bands are OK), only that it sounds without that amazing sensitivity with the whip only. And from 31 mb upwards the sensitivity is indeed notoriously diminished.

But using the longwire, now without a second step ferrite transformer that I had to insert after the magnetic longwire balun for convenient matching witout overloading, I can receive signals in a good manner.

Before the lightning stom, the use of the magnetic balun gave too much signal, overloading the front-end, and I decided to add a second xfrmer, a ferrite bar with 10 turns to the ant/ 4 to the rcvr, near my receiver. The mlb was always connected at the end of the wire and connected the coax to it:

longwire 25 m long ------- mlb------ coax--------- ferrite bar xfrmr ---- Degen 1103

When the problem happened, I had to eliminate th ferrite xfmr.

After a week, I have the replacement now at home received from a company in Miami and I will proceed according to the instructions given at the files section of the group which will be the guide for the replacement operation. This will be attempted with the help of a technician with a proper soldering station.

I hope the replacement will work to return original reception back

My projected FM Filter Mod

But I want also at this time, to make the FM filter mod in order to provide the receiver with better selectivity.

Accordingly, I have got two Murata filters, one for 53 kHz (labeled "131"), the other 110 kHz (labeled "252") from Italy.

The guide published at http://www.bclnews.it/html/filtridegen/filtridegen.htm
gives some instructions.

My Answer to the Group

Which one must go to the right, which one to the left... taking in view, for instance, the third or the fifth picture at that Italian webpage, which is my reference.

Thanks for any indication and help on this!

From: 3CX100A5
Topic: 824 Message: 824

Hi All,

I have e-mailed Media Plaza Shop re the following filters (their order codes & prices shown) but as yet they have not replied:-
MURA150 Murata SFE10.7MJA 150 kHz 2,00 euro
MURA110 Murata SFE10.7MHY 110 kHz 2,50 euro
MURA80 Murata SFE10.7MTE 80 kHz 4,50 euro
MURA53 Murata SFE10.7MVE 53 kHz 5,80 euro
Does anyne know an internet supplier that has them available for online purchase?

Many thanks, John.

Here is a full size picture of the radio. The price is where I had hoped it would be. I'm very interested in purchasing this ASAP based on the astounding performance of my Degen 1103.

I believe this 1121, will probably equal, or surpass the Eton top of the line radio.

Let's get it!

And after you got them I need to know in which order they are installed.
I have the 53 kHz and the 110 kHz.
A photo reference is at http://www.bclnews.it/html/filtridegen/filtridegen.htm
but the pieces are not identified.
Seems that when are cascaded the narrowest goes first but I don't have too much idea
looking at the component view photos.

I finally got the photo depicting the arrangement of two FM filters to substitute. There is also a brief description in Italian (further EG translation and additional comments welcomed on this group).

Seems also we have to temporarily remove/disassemble some pieces of some component (audio pot) for better comfort working in the nearby of the filters and also says something about removing the antenna wires from the PCB.

More ideas?

829. Re: Narrow FM Filters for DE1103

Yahoo group: de1103
Date: 2006-12-11 21:16:34 UTC
From: 3CX100A5
Topic: 824 Message: 829

Hi Horacio,

I've looked at those photos and in the one showing the filters with white rectangles identifying them, the right hand one is the first and the left one is the second. The signal flow at this point is from right to left as the board is shown upside down.
However, I question fitting the narrow filter first!?
I thought the wide filter went first followed by the narrow, if you are using different bandwidth filters. Possibly it makes little difference.
My intention is to buy the full selection (two of each), fit 3 pin sockets after removing the originals and then try various combinations.
The final intention is to select a wide(ish) option for reasonable quality and a narrow option for DX and then diode switch between the two using the existing AM Wide/Narrow switch.
Well that's the plan anyway!!

First I need to find somewhere that will sell me all the filters!

73, John.

Surely you jest! The e1xm has almost everything a top of the line
tabletop has. Are you telling me a radio that is that small with no
passband tuning, filter choices or a sync detector is better than a
500.00 e1xm?? I don't think so. While I to have one on my wish list,
it in no way compares to the e1. That is the best portable around and
will be for sometime to come.

Certainly an interesting-looking unit! Perhaps some of
you who have studied this ad more closely could answer
this: It seemed to me that the description said that
the MP3 recorder would record from FM or microphone,
but there was no mention of it recording from AM (MW) or SW.
Surely if it recorded from one type of radio reception,
it would record from all? So could this record SW
programs? Can you set this for unattended timer recording?
And how long can the MP3 unit record (1 hour, 2 hours, more)?

Will

834. MDS testing?

Yahoo group: de1103
Date: 2006-12-13 03:05:14 UTC
From: Ken Bessler
Topic: 834 Message: 834

I have been searching through the archives but have not been able to find anyone doing a MDS test (Minimum Discernable Signal) on the 1103. Fortunatly, I have the test equipment needed to do this and my KA1103 should arrive tomorrow so after I make sure mine has no defects, I'll hook up at the test bench and see just how good the reciever is on this little gem. I have other radios tested and we will be able to compare the 1103's performance to these radios:

Elecraft K2 #4913 -141.7dbm
Yaesu FT-857D -138.1dbm
Icom IC706mkIIg -139.8dbm
Kenwood TS850SAT -147.9dbm

All tests have been done on 75/40/20 meters with the above numbers averaged over several testing sessions on all three bands that my Elecraft XG-2 operates on. I'll also do a 1uV test (S-9) to see where S9 is on the 1103's meter.

P.S. That's no typo - my TS850SAT heard better than my K2! At first I thought I had goofed in the construction of the K2 so I compared it to another at a hamfest. It's just fine. The Kenwood is simply hotter.

I'll post my test report tomorrow or soon thereafter.

Ken KG0WX

From what I have read, the DE1121 has three alarm timers similar to the 1103 where you can set any (LW, MW, SW, VHF) frequency and time for the radio to turn on. In addition, the 1121 has a record duration attribute for each alarm for timed recording. It will repeat the three events every day unless cancelled. I do not know if there is a programmatic limit to the duration. The 256MB capacity of the flash memory sets a physical limit on recording capacity, depending on the bitrate selected. I think 15 hours is cited for some low bitrate. That said, the user must manage memory utilisation. I have not seen how timer recordings are named - automatically and uniquely or fixed and overrecorded each day.

Many MP3 players have their own FM tuners, so maybe recording FM is based on this.

837. Re: Extended BFO range?

Yahoo group: de1103
Date: 2006-12-16 00:47:08 UTC
From: yzordderrex2003
Topic: 804 Message: 837

Hi Tom,

I hope you don't mind me reply on the top. I have a few points that might be valid.

It looks like pot W701 is connected to the switched power supply at the collector of Q17. I think the voltage is coming from Q17 rather than IC7. (No idea what IC7 is doing) It looks like this (emitter 0f Q17)comes from Q4 which comes from +3v supply. So I can't imagine too much swing on the varactor to begin with as you say. I think W701 could be connected to any supply and you could probably find one that is higher than Q17. I wonder what is teh resistance of W701 so that would it be a big drain on battery if left on VDD at all time. If you change Q17 to a small p channel mosfet you could probably do better voltagewise. Or just hang a discreet P channel whose only job is to turn W701 on. Maybe hang right off of VDD or use small 100ohm with 0.1uf (104p) capacitor to go into fet. (You don't want to modulate BFO with any noise that is existing on the supply.) I would think this could extend your range by way of less capacitance at the hight voltage. Then you could add capacitance in parallel with I think it is C705 - the 100pf connected directly to the 456kc resonator.

I suppose you could look for a diode with larger capacitance swing. The varactor used in the DE31 active antenna has a very large swing as I recall reading.

838. Got any software enhancements?

Yahoo group: de1103
Date: 2006-12-16 01:00:54 UTC
From: yzordderrex2003
Topic: 838 Message: 838

I wonder if DEGEN reads this message board and would pay any attention to any suggestions made here. If you read my suggestions and agree or (especially) disagree I would like to hear comments. I would also like to hear your ideas for software upgrade. Too bad we cant get code (in english)for the processor to make our own code change. I think maybe Samsung processor.

I would like to see the software change so that you have to press AND HOLD the volume button in order to change the volume. As soon as you release button then you are back in tuning mode.

I would also like to see that when you go into hold mode you cannot turn the radio off. On cold mornings when I go for a walk i got may radio and my hand in the pocket and often I accidently press the power button and radio turns off.

Also I would like to be able to go into clock mode while in hold mode. If I want to see what time it is I got to get out of hold mode, go into time mode, and then back into hold mode before I put the radio back in my pocket.

I would also like to see more programming options. One in particular is the antenna selection could be under software control. I would like to be able to use an external antenna for MW rather than the internal stick antenna.

There were a few others but I forget at the moment. Please lets hear your suggestions.

Good bet - it should be regulated. It sure isn't obvious what the supply voltage is.

> So I can't
> imagine too much swing on the varactor to begin with as you say. I

Problem is regulation. I don't think there is a dc-dc stepup and maybe 3V is as high a linear regulator as one can safely use with 4 NiMH cells. Even 4V might not be a big enough swing.

>I wonder what is teh resistance
> of W701 so that would it be a big drain on battery if left on VDD at

I was thinking about switching ceramic resonators, if there is room.

> Then you could add capacitance in
> parallel with I think it is C705 - the 100pf connected directly to
> the 456kc resonator.

I don't see that the upper varactor diode of VD2 is actually dc biased. I wonder if paralleling C705 with 1kR to 10kR would

inherently extend the range at the upper freq with little/no effect at the lower.

>
> I suppose you could look for a diode with larger capacitance swing.
> The varactor used in the DE31 active antenna has a very large swing
> as I recall reading.

Maybe re-wire VD2 so that both diodes are in parallel with C705 and W701 wiper feeds the junction with U8. A smaller (or no) C705 would help the high freq while the doubling of the varactor capacitance would lower the low freq.

Whatever, this looks really fiddly and liable to be unstable if the desired range were to be achieved.

Tom

840. DEGEN DE1121 (OR KAITO 1121) JUST ARRIVED! FIRST IMPRESSIONS...

Yahoo group: de1103
Date: 2006-12-20 02:53:59 UTC
From: daultemostaza
Topic: 840 Message: 840

First at all sorry for my poor english..I´ll try to do the best I can.
As a radio fan here in Argentina, recently I recovered my interest in shortwave radios; in that way, I discovered the Degen radios thru Ebay. I started buying the DE1103, and then the DE1105 and DE11. After that, was the time for the awaited DE1121! I bought it from a Gentleman seller from China (Mr. Tao Qu) TQUCHINA (I recommend strongly to buy from this Seller, he is serious and has excellent communications and service!)and he sent me the radio thru EMS and arrived in a surprising 5 days! Let`s talk about the radio. I am a little bit disappointed. Starting with the body, it is the same size as the 1103 but lighter; I had to double check to see if the batteries were inside the radio, because it is very very light compared with the 1103. The body of the radio is black rubberized (and I don´t like that, because I had a bad experience with my Tivoli Pal which is rubberized too and peel the rubber off after a couple of months of use!). Keys are not back lighted at all as in the 1103. The radio itself has two displays, one main display (which is the MP3 Unit display) and a sub mini display. Starting with the sub mini display, It has not backlight at all (?) and also it is extremely small, and except by the hour, the information (icons) on it are unreadable for the human eye (you should use a microscope to see the icons clearly). Talking about the radio part itself, the main radio display (which is at the same time the MP3 display) is tiny, but not so bad as the sub display, with green led illumination. Also has a simulated analog dial for the radio (nice!) Memories can be labelled using the pc editing a .txt file and transfering it to the radio after that. The AM Broadcast and FM performance is similar to the 1103, but I found (my personal taste) that the speaker of the 1103 has more pleasant sound in FM than the 1121. The most disappointing thing I found in couple of days of partial, short use of the DE1121 is it shows a lot of spurious and/or ghost images over a big part of the shortwave spectrum! I don't know if it is a fault of my unit, but I guess no. I checked it against my 1103 and there are a big difference, no images on 1103! A less elaborate radio section? maybe. Reception once tuned is not bad, audio is not bad, but I need to use the DE1121 more maybe next weekend to have a more deep opinion, but the images are notorious with first use. Talking about the MP3, it is a little bit slow when you go from one file to another (I have a Pogo! RYW AM FM MP3 Portable) and it is by far more responsive handling files. Another big dissapointment was the MP3 memory cannot be upgrade; it is a 256MB Flash memory and no card slots available. I suspect that from the begining, but I had some hope that a slot could be there...no

luck. The recording section is great, you can record radio in 32KBPS with very good sound, but no single button recording; You need to enter the radio main menu, select recording and ...so no rush recordings! In the Pogo! just press the red button and voila!
Fina feelings from this firs impressions...As dedicated radio, I choose by far the 1103 over the 1121. But, if you are like me, a radio maniac and want it all, it is not a bad adition to your collection...specially for the price you can get it from China. The Kaito's price advertised seems to me a lot of money for what you get. I can give you more information if you want, so ask me! Again, sorry for my english, but is better than babelfish traslator! Pablo

Hi Pablo,

Thanks for an excellent first impressions report on the 1121.
Although it sounds a nice RX, your report has confirmed that I made
the right decision in getting 2 DE1103s (one to use, the other to
modify) for Christmas!
I look forward to your next report after more time using the DE1121.

73, John.

Hi Pablo,
excellent review, and perhaps a caveat for those too anxious to get one of those receivers!

It is a general rule that a combo will be hardly better (or even equal) than the sum of the standalone units. Surely there must exist some tradeoff from the commercial point of view in order to keep the price low enough.

What keeps surprising me is how manufacturers manage to make their products even lighter. The DE 1103 must weigh perhaps one half as much as my old and faithful Sony ICF-7600DS which is only a bit bigger. Unfortunately less weight often means a poorer speaker, less plastic and a flimsy product. I doubt that these new products would survive falling to the floor several times as indeed my old Sony has. The problem is that in this category of receivers there is almost nothing not coming from China.

Pablo, thanks for a very readable and informative report. I posted a link to it on rec.radio.shortwave as it is the first user report I am aware of.

I have a couple of questions:

1. If you connect an external antenna located far from the radio via coaxial cable, are the birdies and "spurious and/or ghost images" any better? If so, the problem is with coupling from the receiver circuitry to the on-board antenna and might be mitigated by shielding modifications similar to those for the DE1103.

2. Are the birdies and "spurious and/or ghost images" any better with the MP3 recorder removed far from the radio and antenna and shut off?

3. How is SSB reception? Does the Fine Tuning range extend to +/-2 or 3 kHz?

73, Tom VE3MEO

Thanks Folks for your kind comments in my humble post!
The ghost images (major from strong AM and also FM local stations) are still present even taking the MP3 unit off from the main radio body. I have no external outside antenna right now, so I am not able to check if the problem remains with that kind of antenna, with coax cable. I also check reception with the wire that cames with the radio, and with a amplified indoor whip antenna (a sony brand) and things gets worst in some parts of the SW band. Maybe next weekend I will be able to do a mini dipole so some more deep analysis could be done, but first hand I could say that the problems is based on a shield issue. Performance in SSB is not bad, very similar to the DE1103, but I cannot tell you the SSB clarifier offset (I didn't see it noted on the owners manual). I bought the DE1121 mainly for listen podcasts and some recordings on the go. That was the real plus that move me to buy this new model. I have a DE1105, DE11 and DE1103 and again, I can say nothing beats the DE1103 as a portable for the radio listening. Let me say if you can buy it direct from China sellers (I strongly recommend TQCHINA as I told in my first post) it is a not bad unit to experiment on it and the MP3 capability is a nice adition, but I refuse to pay what KAITO are asking for the unit in the United States. I like the idea of have a SW Digital Radio Recorder in such small size but I would like it with a slot so you can throw a card (SD CF etc) but not possible with the DE1121 which is stuck to 256MB internal Flash Memory. I think in a short time a DE1121 group will be born, and there is a lot of material to discuss about. If you want to know any other aspect of the radio, don´t hesitate to ask me :) Pablo.

845. New TG35 ACTIVE ANTENNA

Thanks for the update, Pablo.

I should have narrowed my question to exclude "ghost images", and include only "birdies and spurious" signals. Images due to the heterodyne principle are to be expected to some degree, independent of the digital electronics. I was really asking about interference from the receiver's own digital electronics and that of the MP3 recorder. This might sound like hash or cyclic patterns, not like an audio program.

A simple test of the SSB Clarifier offset is to tune to a known carrier of accurate frequency, e.g., WWV or any good broadcast station, in AM mode - set the receiver frequency to the transmitter freq. Switch to SSB mode and rotate the clarifier to its extremes, measuring the frequency of the carrier's audio heterodyne or beat note at these points. You could measure by playing a known instrument (e.g. a tuned piano or calibrated audio oscillator) near the same pitch, by feeding to your computer sound card and measuring with spectrum analyser software (e.g., Oscillometer, CleverScope, VisualAnalyser, Spectran, Spectrum Laborarory), or you could record it to a sound file and send it to me and I'll measure it. ;-)

Tom: Regarding the first issue, I can only report ghost images from local stations, not birdies or spurious signals detected so far (at least not ones too evident). About the SSB clarifier offset, I promess you when I have some time I gonna send you a recording of the tunning so you can be able to analize it. By the way, day after day I have encountered new "lacks" of the DE1121, one very remarkable is no way to schedule unatended radio recordings (?)..I consider it a major flaw, because it is supposed that somebody wants to do unatended recordings while is not at home, taking advantage of the digital recorded included in the radio. (my loved POGO RYW LX does that job flawlessly, letting me to hear some radio shows when I come back to home after work). Regards. Pablo

I read that the 3 alarm timers can be independently set to unique
frequencies and that there are associated recording durations if you
want a recording to start at the alarm time.

The effect will be negligible, given the volume of air that has to be moved.

Joshua: Can you elaborate on the encoder problem here. I have just recently noticed that I experience the same tuning issue that Leon described, almost exactly, but as said just started within last couple of weeks. I bought my Kaito 1103 two years ago, Jan 2005. And, just like Leon, after a bit of time the issue goes away. It does seem to be related to "cold." thanks for any clarification.

Ok, thanks Leon.

The only reason I brought it up was because my boss had a finger guard for a muffin fan that he had designed with drilled holes - like the Degen speaker grill. I told him to change to the normal wire ring and he was amazed at airflow. It was of course due to turbulance. On a small speaker I guess you wouldn't be pushing so much air - or have so much turbulance.

Speaker still sounds like crap though. I had difficulty listening to football game on the radio. I am searching for a better speaker.

Mine sounds pretty good, it's more likely to be a fault with the amplifier.
I think that Degen has rather poor QC, and some duff radios have got out.

I think restricted air flow is necessary to emphasize certain freq. --
- the whole radio case served as an audio resonating chamber. Take
the DE1103 "guts" out from its case and compare the outcomes. (in
order to creat a 100% none restricted "airflows")

It's not that so much as the requirement for a speaker to be mounted on a baffle or on a sealed enclosure, to prevent the sound waves from one side of the cone interfering with those from the other side. That's the reason why speakers without some form of enclosure don't sound right.

Topic: 859 Message: 859

Hi all,

I tested simple attenuator with variable resistor 2k5 and two diodes with my Degen and mini whip antenna and it work very good!

Here is also other good idea: you can use box with more connectors for antennas: jack, cinch, PL, IEC...

Regards, Jara Rat

Topic: 840 Message: 860

Hello all..

This week I have bought a Siebel Edition DE 1121
The first impression was very good. This is an excellent receiver!
Very sensitive, on all bands, have listened to many stations. Clear
and quiet sound,was very impressed, compared the results with my
Kenwood R5000. I did also a test on the amateur bands, great! Many
hams on the 80 meter band, 3.600 and up. I use a longwire, 10 meters,
with a magnetic balun connected with the wire.
The receiver has a build in mp3 unit, small but good readable display.
One of the interesting points is also the handling of stations and
frequencies. There are 100 memories for stations and for each station
you can set 4 frequencies. You can edit this (stations and
frequencies)with a text file (frequency.txt) on your computer. After
editing or adding this file you transfer the file to your mp3 unit
with the usb port and put the unit back in the radio.
Then you load the file. The receiver has the possibility to select
the frequency which is best to hear.
This is a first impression, I already like this receiver after a
short period of testing. Is there also a yahoo group for the DE 1121?
If not it would be nice to have one..!
For reactions you can write in this group or send me an email:
hansstam@...
Regards
Hans

Topic: 851 Message: 861

From the beginning I was not satisfied with the sound of my recently purchased DE1103, however I don't think there's anything wrong about it, it's just a poor loudspeaker and lack of accoustic design. It sounds like... a chinese radio. I have also read somewhere that Degen used small-value capacitors in some critical points of the audio circuit, thus decreasing the bass response. They may have chosen to do that, as have been suggested, to save a few cents, or to hide some kind of low frequency distortion. But you can't have it all for 50 bucks. The receiver sounds pretty good through the earbuds or through amplified external speakers.

Grundig [the true one] is no longer in the radio business, I doubt we will ever find again a portable receiver combining world band coverage, good sensitivity, aceptable selectivity, AND excellent sound.

Perhaps the 1103 could be enhanced just a little by changing the loudspeaker, provided you can find a good one that fits the case, but don't expect Hi Fi from a 3-inch speaker. This is a pocket radio. And a very good one.

73 + Season's Greetings

From: epsilon2675
Topic: 863 Message: 863

Hi,
I've had my radio for about a month now, and it worked just fine. Yesterday I turned it on and- no AM or SW!!! FM is fine. I tried reset but nothing happens oother than the radio shutting down and starting up on FM. I've taken out the batteries and put them back. I've tried running it off ac. I've tried with an active antenna and without. The radio was fine when I turned it off the night before.

Any ideas about what went wrong?? Thank you, Tom

However if you simply take the speaker out alone (i.e. in free space ---
no way to interfer the cone from the other side.), as you said
" ... without some form of enclosure don't sound right. "
Nevertheless that was what I experienced when replacing my car's
speakers last year ---- Low freq.response and overall outputs/loudless
dropped noticably but returned normal when reinstalled back to their
original enclosures. Any idea?

Topic: 865 Message: 865

Hi all,

I use only two modifications in my De1103. 1/ output with signal for external RDS decoder and 2/ tuning from 15kHz from setting memory.

And here is one very interesting thing, which I dont know with other receiver. If you tune (by knob) from 15kHz up, feritte antene and also her preamlifier is off. But you can use telescopic antenna!!! Antenna use FET preamlifier and work as "mini whip antenna!"

I can heard for instance time stations 60kHz and 77.5kHz, and Non directional beacons or many stations at LW or MW band too!

Some NDBs I heard better with telescope than with feritte!

regards, Jara Rat

Hello..

you can record radio programs in mp3 format, stereo, 32, 80 and 128 kbps
You can record external sources in mp3 through the line-in, also 32, 80 etc.
And you can record in wav, 32 and mono with the built-in microphone.

32 kbps is ok for voice recordings, 80 or 128 for ukw recordings
If you record with 128k you can record 4.55 hours
if you record with 80 k, you can record more than 7 hours and if you record with 32 (radio records) you can record 18 hours..

Try a full reset of the radio.
Press these 4 buttons at the same time and hold them down for 2 seconds.
Power, Reset, Hold, Time.
It's a bit tricky but you can have someone help you push the reset
button while you do the other 3.
If that doesn't help and you still have problems get in touch with
Kaito USA about your warranty.

Hello Lidael,

DO you know what caused them to burn? Overloaded front end?
Thanks,
Tom

873. Re: speaker grill Question

Yahoo group: de1103
Date: 2006-12-27 04:18:39 UTC
From: Phil Pasteur
Topic: 851 Message: 873

I have had my 1103 for over a year. The initial radios had some known problems. Mine had a really nasty sound to it for any kind of listening. I bought a Sony 7600GR at the same time that I purchased the 1103. I could not believe how bad the 1103 sounded beside the Sony. It was really bad!

I found out that, at that time, a few resistors that were being used in some of the radios caused distortion in the audio stage.
I followed the instructions that (sorry if I am off on the name) Gary provided in his fix. I also bought the replacement caps from KIWA, and their diode anti static mod for the internal antenna (this having nothing to do with audio, obviously).

I installed the proper resistors and the KIWA mods which provided the audio amp with the proper resistances and capacitances (likely the KIWA mods are a bit of overkill, providing AUDIOPHILE level components). In any case ...I think that it cost about $18.00 including shipping for the parts.

I immediately noticed a huge improvement in the audio after the installation. My lady friend, who had told me how crappy the 1103 sounded... The next time I fired it up when she was here... she asked me "what did you do to that thing". She was the one I gave the 7600 GR to. A few weeks later she brought it over. It was now very clear that the 1103 sounded much better. !!

So, it is my thought that the speaker itself is not the root cause of the sound quality issues with the 1103. There may be units that have bad speakers, but if they still have the speakers that I got with mine installed,
Well, if the electronics are putting the proper signal to the speaker, it is adequate to provide surprisingly good sound out of a pocket radio. Better than the 7600GR and better than my Sony 2010. Also as good or better than my Sangean ATS909 too. Not nearly as good as my E1, but ...what can you expect???

Now you might ask, what does "sound better" mean to me.
?

Better for SWL means intelligibility. The little speaker cannot have as much low frequency response as larger ones. But when the electronics are delivering the right stuff to it, it can be very clean and clear. It can, and does, give me a listening experience that does not make me tired from listening for long hours, and it does produce a response that makes it easy for me to understand speech in some difficult conditions. This it does very well! (most especially for its size and price)

Don't take me wrong, it can never be a Hi Fidelity music reproducer through the internal speaker (though it is not too bad on FM with earbuds or using

the line out). Mine is not, but it is a small radio that allows me to understand speech well and is not tiring to listen to!

If your speaker is known to be good, getting the right parts and spending a couple of hours getting close to your 1103 might just get you where you want to be.

Phil P.

From the beginning I was not satisfied with the sound of my recently purchased DE1103, however I don't think there's anything wrong about it, it's just a poor loudspeaker and lack of accoustic design. It sounds like... a chinese radio. I have also read somewhere that Degen used small-value capacitors in some critical points of the audio circuit, thus decreasing the bass response.

Pablo,I salute you.It sounds like you have been able to actually use
the 1121.I've had mine for about a week and just got around to fooling
around with it today.After two hours I finally got the clock set to
the correct time,but I don't know how I did it!This thing is
incredibly complicated.Now surely the group thinks I'm a moron and
technically challenged.Such is not the case.The timer settings to
record are impossibly difficult.I'm planning on using the unit as an
mp3 player with a speaker and radio.But no timer recording.I'll
continue to use my Pogo RadioYourWay LX for recording.The manual for
the 1121 is poorly written and no fault of the translator,and I think
the device itself is poorly designed.Bottom line,I would wait for a
second generation unit or at least an improved version of the current
model.If anyone in the group buys an 1121,be advised the manual does

not tell how to remove the mp3 from the radio.There is a flat button on the back labeled Open(mp3).There's no indicator to tell you what to do.Slide up,down,left,right?Push?Pull?The secret answer is-----
push in very hard.It won't break or at least mine didn't.This pops the mp3 up about three sixteenths of an inch,and nimble fingers can barely grasp it and pull it up and out of the radio body.Hope this helps somebody.I was soooooo sure I would break something.

Based on what we will actually be able to hear with stations shutting
down every year, and the price difference, I still think the DE-1121
is a better value than the E1XM. Then I can take the extra $100.00
and buy one of those excellent boom box external speakers for shortwave.

My Degen 1103 is still picking up stations in Europe clearly,during
the middle of the day off the whip which my Sony 2010 attached to a
50Ft Scantenna on the roof doesn't even hear.
That is really awesome to me.

I'm going to be buying a radio in the $500.00 range soon, but it will
likely be the ICOM-R75, and not the portable E1.

If money is no issue, buy them all! :-)

All the best
CB

Leon,

What KIWA has done is to take the engineering drawing for the audio pre/power amp and provide the parts that provide the recommended values. Degen did not do this. Whether this was by design to tailor response, or simply to save a few pennies on each part, I do not know. In addition the parts from Kiwa are audiophile type parts that you might find in multi thousand dollar type high end audio gear. Admittedly this is very likely overkill in this application. That being said, if you like the way your 1103 sounds now, I would wager big bucks that you would really be impressed to listen to it with the Kiwa parts installed.

Granted part of my audio problem was due to some resistors that had the wrong values causing the audio section to distort. Getting rid of that distortion made up a significant part of the improvement in my radio. I also understand that this problem was fixed in later production runs (and not all early radios experienced it either). But there was a significant change in the character of the sound from the Kiwa parts as well. It is fuller and smoother and just more pleasant to listen to for extended periods. BTW, I have listened to several un-modified 1103s and the difference is significant. I would recommend the mod to anyone looking for that little extra bit of sound quality and who has some patience and is reasonably good with a soldering pencil.

Phil P.

2b. Re: speaker grill Question

I beleived only those early DE1103s encountered audio problems and
the later models should be OK(including mine). Wonder if the DE1103
you bought a year ago is part of those leftover "OLD" stocks.
More over owing to the late design changes doubtful if the $18 audio
modification will creat night-and-day wonders. Nevertheless I will
hesitate to try the $18 modifications myself --- modifying those
delicate SMC(Surface Mount Components)without suitable equipments and
capability can cause more harms than good. Again would like to learn
more how you did such modifications against those delicate SMC parts.
(I never successed to remove any SMC parts --- Despite the fact that
that never tried in the DE1103 yet!)
Thanks.

While I understand your happiness with the 1121, remember you get what you pay for. If you are going to spend 79.00 for a radio you are going to get a 79.00 radio. The moment you have to send it back to China for repair your bargain went right out the door. Why buy an external speaker which only adds to the cost when you can get that quality right out of the box.
Yes the shortwave world is rapidly vanishing. It's really sad that the VOA, BBC and others are gone, with Japan to follow later in 07 English and other languages are soon going to be gone. The vast wasteland of shortwave will be left to the religious right. But they are smart, they still realize the importance of shortwave to reach worldwide audiences. Okay off the soapbox.
If you by the R75 better plan on external speaker with it, the speaker is awful in it. If I were you and I'm not so it's only an opinion, I would find a used E1 for around 390.00 and buy it. You will be very happy and pleased with the radio and the full room filling sound that comes from it.
No flaming, just one listener's opinion. Take it for what it's worth (about 2 cent's I believe)
73 and happy listening!
Harry

I'm still waiting for my DE1121 to arrive. My Redsun RP2100 that I purchased from tquchina is a great radio and still going strong. You could buy two DE1121s (just to be safe), and still spend less than the Kaito.

I'm disappointed too by the lack of SW broadcasts, but despite what some people here have written, I'm planning to use mine to record AM, FM & SW broadcasts to mp3.

Topic: 851 Message: 882

You are correct about the distortion problem, as I also mentioned this seemed to be a problem with early production radios. Even then, not every radio was affected. I tend to think that it was likely due to tolerances in the audio chip. The fact remains though that those radios had values for some resistors that did not match the requirements defined in the spec sheet for the audio pre/power amp chip. In my case, getting the proper values in definitely got rid of a nasty level of distortion.

Fortunately the replacement of the caps with quality parts having values matching the requirements of the engineering drawing for the audio chip did not involve replacing any surface mount parts. All parts were "normal" solder through components. In one case it was a matter of bypassing an existing cap with a quality part. The whole project, which included fixing the resistor values by adding a couple of resistors in parallel, replacing IIRC 6 caps, bypassing one, and adding the static discharge diode protection mod took about 2.5 hours. Someone that really knows what they are doing could probably do it in less than an hour.

A friend got a Kaito 1103 a couple of months ago, when we put the two radios next to each other for a comparison, he was the first one to point out that he thought mine sounded "way" better. So it may be doubtful, but at least for my particular radio, the mod made a significant positive difference in the audio. It sounds like a "bigger" radio (better low frequency response), yet the higher frequencies are cleaner and clearer making for better intelligibility on week signals. As they say YMMV.

I beleived only those early DE1103s encountered audio problems and the later models should be OK(including mine). Wonder if the DE1103 you bought a year ago is part of those leftover "OLD" stocks.
More over owing to the late design changes doubtful if the $18 audio modification will creat night-and-day wonders. Nevertheless I will hesitate to try the $18 modifications myself --- modifying those delicate SMC(Surface Mount Components)without suitable equipments and capability can cause more harms than good. Again would like to learn more how you did such modifications against those delicate SMC parts.
(I never successed to remove any SMC parts --- Despite the fact that that never tried in the DE1103 yet!)
Thanks.

>Hi yrag4931!
I think I am not the only who had problems with the loved/hated
DE1121
After used it about 2 weeks more or less I have not a clear opinion
about it. As I told, I have a lot of images from AM and FM Local
stations over the most part of the SW band.
The radio section doesn't satisfy me at all. I think the DE1103 is
by far better radio than the DE1121. But with few SW stations on air
today (and less the next year, as I read a lot of stations will go
out of the air in 2007) the SW is near to the end, so I focus in the
AM FM and MP3 section, and I love the concept of the de1121; a
little radio recorder for this century! digital...but with little
memory for these days (only 256MB not upgradable)..so it is a shame,
but as you I hope in short time DEGEN or any other radio factory

improve this concept.Like you, I have also a Pogo! RYW LX and I love it (now with 2gb sd card) and I record a lot of AM and FM shows unattended in a snap...but the speaker in the Pogo! is almost unusable, that's because I think the DE1121 concept will be a starting point for radios with mp3 recording/playback capability..but at least give us the chance to throw a SD card on it! Regards. Pablo

It is possible to make unattended recordings with the DE1121--I've made three since mine arrived. The instructions are obscure, but on page 12 of the manual it (sort of) explains it. Timer recordings are a variation on the alarm settings. The settings are daily, so you couldn't set it just to record on Tuesdays, but otherwise it works pretty well. The big advantage it has over the Radio YourWay is the ability to record SW and FM. My Radio YourWay has very poor FM reception. I posted the steps to set the timer recorder on the new DE1121 group.

886. Using the memories

Yahoo group: de1103
Date: 2007-01-03 18:27:10 UTC
From: wgmartin999
Topic: 886 Message: 886

I'm one of the people who had not filled up the memories on my 1103, and just recently thought of something and did it and find it quite useful:

I picked a spot (happened to start at memory location 40) and stored in all the US medium-wave band channels (520, 530, 540... up to 1680, 1690, 1700, 1710). So now I can scan the MW band by switching to memory mode and just slowly advancing the knob. It's easier than tuning by 1 kHz steps and having to be sure you stop on a frequency ending in "0" when casually listening and bandscanning. If you are interested in other MW frequencies ("splits" and transPacific/transAtlantic), you can simply revert to by-frequency tuning.

I find the 1103 quite a good MW radio, despite its small size (and thus small ferrite rod).

Happy New Year to the group! 73, Will

888. Audible proof that the 1103 is remarkable on MW (AM)

Yahoo group: de1103
Date: 2007-01-04 23:10:58 UTC
From: gary_thorburn
Topic: 888 Message: 888

Check out the recording of Morocco on 612, heard on my 1103.

daslied.com/badx/maine2006

Recent posts have commented on what a good MW receiver the 1103 is, even with just the internal ferrite rod antenna. I occasionally take a DXpedition to an electrically quiet location on the Maine coast, with fellow members of the Boston Area DXers, for some serious shortwave and Trans-Atlantic MW DXing. My main receiver is a Drake R8A,with a broadband loop antenna set up on the rocks just 50 yards orso from the water.

This past November, I also brought my 1103, and could nicely hear Morocco on 612 and Algeria on 549, on the "barefoot" 1103, that is, no external antenna or connections of any kind.

The recordings are taken from the Drake R8A, except for one, made from the 1103. You'll see two entries for Morocco 612, the second one is taken from the 1103, using a microphone. (The Drake is directly cabled to the recorder).

You will hear a 2kHz beat tone, the mixing product of the 612 signal with WGIR 610 kHz, Manchester NH, or whatever else is on 610. This tone is easily filtered out on the Drake. At the end of the recording, I plug back into the Drake for comparison.

In the interest of full disclosure, be it known that I have done the Kiwa and KD1TE audio mods (described in the files on this forum). However, this should have had no impact negatively or positively on the RF peformance of the 1103.

Today my KA1103 arrived. OK, it is one hot receiver. I find that my idea for a concealed, easy to do antenna worked with this receiver also. Try this: connect the receiver antenna input to the green wire ground of a nearby power line. Make sure the power connector is wired correctly first. This connection goes directly to the power entry ground spade driven in the earth.

Just to prove that all that glitters is not ground, at least for RF. Comments?

890. AM band memories

Yahoo group: de1103
Date: 2007-01-05 22:22:00 UTC
From: pappy042240
Topic: 890 Message: 890

Thanks for this idea to set up AM memories on 10kHz steps.

To further discuss this, suggest using the 'hidden' memories for this which still allows you to use the 00 to 99 memories with the key stroke. Also suggest starting at 1710kHz and working down, since those top frequencies have fewer stations. You will use 120 memories.

1. Set frequency, hold STORE, MEM will flash, rotate FREQ dial CCW one step down from 000, FREQ display will turn to dashes and release STORE. Push STORE again momentarily. Push M/F. Dial FREQ down 10kHz etc.

I kinda like this radio.

891. 3 versions ?

I heard that there are three versions DE1103. How to find out which version I have. What are the difference ?

892. ESD paranoia

Yahoo group: de1103
Date: 2007-01-07 17:27:09 UTC
From: pappy042240
Topic: 892 Message: 892

My brand new KA1103 arrived recently and I was scared to touch the whip because of many complaints of apparent ESD failures. I got over it somewhat, however here are several suggestions for reducing the ESD fear.

1. Avoid shuffling across a carpet or sliding on a seat.
2. Discharge youself to ground whenever possible.
3. Touch the receiver earphone jack first, to equalize ESD. Even touching the external antenna jack first will help.
4. Disconnect any outside antenna whenever you are not using it. Even the wind will charge up an antenna.
5. Avoid touching the radio extended whip to any object which could have an ESD charge. For example, peeling tape off a roll will charge up the tape, the roll and yourself.
6. Purchase the 'Square Trade' insurance when offered.

If you open the receiver to do your own repairs, this will void any warrenty or insurance. Use an ESD work station, bench conductive pad with Megohm resistance to ground, and an ESD wrist strap with 1 megohm to the pad.

If you wish to ask, I will respond to questions.

893. Re: ESD paranoia

Yahoo group: de1103

From: knyuen88
Topic: 892 Message: 893

I am confused, please advise.
Since the mentioned DE1103 is still isolated(not connected) to grounds
(not at the same earth ground potential), how can the "Discharge
youself to ground" via the receiver's earphone jack ground(the radio
ground)be completed in order to drain(equalize ESD) the body statistic
charges?.
> 3. Touch the receiver earphone jack first, to equalize ESD. Even

894. ESD discharge

Yahoo group: de1103
Date: 2007-01-07 22:14:05 UTC
From: pappy042240
Topic: 894 Message: 894

Hi, Knyken: Thanks for considering my suggestions for ESD control.

Consider the equivalent circuit: The human body is expressed by a 100pF capacitor charged charged to 4kV (The ESD test voltage) discharged through a 1500 ohm resistance. Of course, actual charging could be easily 10kV and often as high as 30kV. Sometimes the actual capacitor is as high as 1000pF.

Then the discharge path for damage is through a semiconductor junction which is destroyed by the current surge. The junction in question has some connection from the antenna to the radio 'ground'. Hopefully, the radio 'ground' is isolated from the earth ground by a high impedance. Perhaps you have explained why there is a limited number of ESD failures.

Consider when you slide across the car seat and touch the door handle, a significant ESD arc is caused. The car is not at earth ground. It is at car 'ground'. Four kV is the typical ESD protection for semiconductors, which is the level you can barely detect. Those big shocks you feel are way higher than 4kV.

ESD protection is doing those things which reduce the ESD surge current in the semiconductor junction to a level which the junction can tollerate. My suggestion for you to touch the headphone jack is to discharge your ESD capacitor to the radio 'ground'.

Thanks for allowing me to contribute to your understanding of ESD.

However if u step out over a piece of insulated metal/conductor instead of the earth ground. Or simply put you fingers to another car's handle parking next to you --- before leaving your car. Dont think will receive any high voltage shock(discharge) because this piece of metal/handle (i.e. equilvalent to the DE1103 chassis ground) is still not grounded(insulated) to the real earth. Those "high" statistics charges is still stored in your body and find no way to "Drain-out". True?

I just got a KA1103. It is the best shortwave radio I have ever owned. Very impressed with the recieve on this little jewel. However I am having trouble with a buzz when listening while the AC Power Adapter is connected. It is loudest on the AM band and slowly diminishes as I tune up in frequency. But there is always a slight buzz which completely disappears when I disconnect the AC Power Adapter. This happens with or without the External Antenna connected. And I have tried plugging the AC Power Adapter in other AC outlets as well. Something peculiar I have discovered is that if I touch the front of the radio the buzz disappears. I have several questions. Anyone else having this problem? What is causing this buzz? Is there a way to eliminate the buzz besides holding my finger to the front of the radio constantly lol:)? I have thought about trying a ground. But there is nowhere to connect one. Any input would be greatly appreciated.

Hello...
just a thought on the ac buzz, I purchased an 1103 from Kaito USA, it
came with the power adapter, horrible ac buzz as you described.
Called Kaito, they where unaware of problems with adapter. They sent
me another just as bad. I tried using my adapter from an E5 I have,
problem dissapeared. All adapters that are "turtle backed" are most
likely to be faulty. The turtle back adapters are very well known for

their noise in the early E5 sales, now they come with a more squared off design.
Regards..

Topic: 897 Message: 900

When I took my -1103 to my in-laws' in Atlanta GA (USA) over Thanksgiving, it was overwhelmed by buzzing, even when using battery power. I found the source of some of it - there were several touch-control lamps in the house which made a racket through the radio even when they were turned off. Had to unplug them. A lot of buzzing remained; I didn't go through the house unplugging/disabling things since it wasn't my house :-) My own house has some buzzing too but nothing like my in-laws'.

I looked into snap-on ferrite cores for power cords and found these:
http://search.ebay.com/_W0QQsassZweb_shopper_n_auctioneerQQhtZ-1
A 10-pack is $14 including shipping. Anyone tried extensive use of these? (Radio Shack also carries one but it's hideously expensive [$5.29 each!])

As an experiment I may turn off the main power switch for my house to see how much quieter things get on the radio. January 14 is forecast to be 68F (20C) here in Asheville NC (USA) which would break the high temperature record by 5F so we won't need the furnace running that day...

- Dave

Believe the ext.ant connector one side is connected to the radio's ground(the outer skirt-- not the tip of the plug). And so does the headphone or the line-out sockets. Please double check/confirm the schematic in the File section of this forum -- just in case if I am wrong.
On the other hand this File section also listed a Russian SWL's info about adding extra shieldings inside the DE1103 too.

I have thought about trying a ground. But there is

Hi again: My purpose in writing the several suggestions is to reduce the chance of damaging the sensitive and fragile semiconductors connected to the whip and to the external antenna jack. I discourage you from opening the radio for any reason. I encourage you to purchase the very reasonable insurance to continue to make the manufacturer responsible for ESD failures. In any event, avoid touching the whip antenna first.

The very best way to guard ESD failures is to set up an ESD work station, i.e. a conductive pad over the bench top connected to ground with 1 Megohm resistor, a conductive wrist band connected to ground with 1 Megohm, and the receiver itself connected to ground with 1 megohm resistor. This is the setup manufacturers use to assemble and test ESD sensitive equipment today. Of course, even this will not 100% guarentee failure free, but almost; and it will not allow portable operation of a radio.

There are some very good internet sites which explain ESD in great detail and I encourage you to invite them to your PC display.

Thanks again for your thoughtful questions.

However if u step out over a piece of insulated metal/conductor
instead of the earth ground. Or simply put you fingers to another
car's handle parking next to you --- before leaving your car. Dont
think will receive any high voltage shock(discharge) because this
piece of metal/handle (i.e. equilvalent to the DE1103 chassis ground)
is still not grounded(insulated) to the real earth. Those "high"
statistics charges is still stored in your body and find no way
to "Drain-out". True?

From: mushlee
Topic: 903 Message: 903

I want to buy another Kaito KA-1103 but my last one died due to the tuning wheel no longer working after numerous failures that lead up to its ultimate demise. Is this still an issue with the 1103? Is there a particular batch of radios that are experiencing this problem or a particular color (I know that sounds crazy but just thought I would ask)? I really like the line-out feature on this radio, and it does have other nice features and excellent reception. But I don't want to buy another defective 1103... Thanks

Can anyone confirm if the outer skirt on the antenna jack is a ground.
I already have a ground rod in the ground outside my window I could
use. I just need to go to radio shack and pick up some wire and an
1/8" mono plug. I have been thinking about making my own antenna
anyways. Or maybe I could somehow connect a ground to the front of the
radio?

Yes,just checked my DE1103 (with an Ohm meter). At least the outer skirt of the ext.ant and the headphone plugs/connectors are grounded and connected to the radio's front "Silver metal" pannels directly. Nevertheless try it youself and confirm.

Hi,
I have the same problem with my radio. I checked the radioscanner.ru website and there are quite a few complaints about the jog dial. It seems that in the current version of the radio the problem is fixed. I contacted tquchina on ebay about buying a new jog dial.

909. Something went wrong with my Degen 1103!

Yahoo group: de1103
Date: 2007-01-09 20:00:09 UTC
From: Horacio Nigro
Topic: 909 Message: 909

I took my Degen 1103 this afternoon, to a qualified service man experienced not in radios but in microelectronics. The goal was to substitute the burnt FET from the front end, and then also change the filters for the FM selectivity. A soldering station and proper tools were used. We took near 2 hours, in a process that takes much patience and care.
All was done in my presence, working carefully and I helped with assistance.
When all was reassembled and the radio was turned on the radio sounded well for the first seconds, then dissapearing all sound. The signal was there, the logics of the receiver is ok. If I wait some minutes and turn on again, the signal comes but again with voice... but then after seconds it gets mute. Only once seemed to stay longer than the 2 o 4 seconds, but it repeats the problem.
Bad mood on me at this time :(

Check if the batteries are weak in the first place. Replace the original batteries with known good ones; otherwise cannot rule out if certain compoments/wirings were damaged/miswired/cold solder joins .... etc. during the trouble shooting/replacement process ---- good luck !

Many thanks for this first comment on my post.

I will recharge the batt's (the ones that came with the rcvr) in a external charger). But the receiver was operated/tested after the mod also with the voltage adaptor which came with the set, which I understand is a good one. No hum at all.

And also want to add that the sound dissapears gradually... afters seconds. The longest the receiver is off, the longer the sound lives. If I re turn it on/off several times, there is no audio reaction.
Another detail to add... the speaker leads were removed and then reconnected. This is the only thing directly related to the audio section which I can recall.

Horacio,
sounds like a capacitor charging and discharging... perhaps the normal circuit was somehow altered during the repair and now the capacitor charges through a high resistance path. It might be a capacitor in the power a supply line... or not. Well, it's only theory. Whatever the cause of the malfunction I'm afraid that the receiver shoud be operated on again :-)

I would check the solder in the speaker leads and every other part that could be unsoldered or simply pushed when handling the PC board.

Does the sound go away only in the speaker? Did you check if the line output and the earphone output are also dead? There is a chance that the line out is still alive. Then look for bad solder, first in the speaker circuit and then in the audio circuit. Also try all modes: AM, SSB and FM to see if more info can be obtained.

Good luck!

Moisés,

Seems reasonable to assume he meant "remove the back from the case". There are eight screws visible on the unit; one fastens the antenna to its base and six of the remaining ones have arrows pointing to them. This is a convention meaning, "these are what hold the cover on." Before it was adopted, there could be unfortunate results from enthusiastic folks like me removing *every* screw, then having the innards come out in pieces/modules... :-(

Loss of precision across languages happens periodically. I often have quite a time just within English - didn't intend my original comment as a serious criticism.

peace - Dave

Thanks for your comments!

Last night, the first after the mod, I kept the receiver turned on. After some offs and ons the signal kept at medium level. Then after a while it kept normal all the night. Only at the following morning it returned to the problem.

One thing I saw is that when the rx is not OK there is no indication of the signal strenght sign on the bar graphical meter. Also there are growls in the process of audio/signal falling down. Also intermitent millisecond audio pops.

Tonight I will make another session.

The problem is also present when using headphones. The new FET works since signals are much better.

Well, after all day I stored the receiver off the AC power, inside the pouch and with their batt's fully charged since the former day, when I returned back home from work I turned it on all night and no problem was experienced. So I think the problem has vanished, (maybe a shortcircuit or something transitory). The receiver is working well for the moment.

Seemingly your batteries were never fully charged. No doubt weak batteries when underloaded will cause a lot of unpredictable symptoms-- the accurate way to check a fully charged battery u need to check it with a LOAD rather than just take it out and measure the voltages ! If my memory is correct u received the DE1103 only recently and likely you charge it(with the DE1103 built-in charger) only a few hours rather than overnights when it arrived, true?

Yes the batteries were charged twice from the built-in charger -not overnights, that's OK,, followed by an instance when they were charged with Maxell brand external charger. And yesterday with the external charger again. I plan not to use further the built in charger. The external takes shorter time.

But I don't understand why if I am applying voltage from the AC via the AC-DC converter voltages this is not enough to keep circuit tension and current parameters normal within the receiver.

It's certain that the batt's were not at full charge immediately before the mod was done. Then with those under normal voltage batt's the problem appeared, no stable solution appeared with the ACDC power adapter connected either, but when batteries were charged, and the receiver was used from the AC outlet the receiver worked for near 6 hours. Then I took off the AC/DC supply, and the receiver was stored, of course turned off, with fully charged batts and the hold button pressed down.

Normal behavior since this, up to now. I not use batteries, though they are inserted. I use the AC outlet.

Thanks for comments again!

Horacio

knyuen88 <knyuen88@...> escribi?:
Seemingly your batteries were never fully charged. No doubt weak
batteries when underloaded will cause a lot of unpredictable symptoms-
-- the accurate way to check a fully charged battery u need to check
it with a LOAD rather than just take it out and measure the
voltages ! If my memory is correct u received the DE1103 only
recently and likely you charge it(with the DE1103 built-in charger)
only a few hours rather than overnights when it arrived, true?

I am as confused as you are. May be we need to monitor the batteries voltage and make thoughful analysis continuously . Furthermore when problem(s) arose did the display faded out (reducing contrast)--- an indication that the batteries voltages is dropping -- or became blank immediately? Nevertheless please keep us informed for any new development.

No... the display always was OK. Just, that no indication of the signal on the graphic bar was seen, when the audio/signal faded out. This is why I think it was more in the RF section than in the audio one.

Even when the signal graphic bars disappeared is the station freq. still remained in the display screen(also able tuned to other freq. afterwards)? How about the charging bars, clock displays ...and other functions? Were their symbols still shown in the displays and functioning? Since both the AM and the FM signal chains/components are unrelated,except for sharing the same power sources --- unusual low voltages at the commond supply source(s)? If this is the case even if the followered audio IC amplifier works properly the audio should be weak/dead anb highly distorted at best.

Hi All,

Sorry to hear about your problem Horacio.
However, I think the batteries being low is not likely to have been the problem. The 1103 monitors the battery voltage and turns off the set before malfunction of the receiver occurs.
I am surprised (but pleased) that the problem seems to have gone away. I was fairly sure you would have to open the receiver again and check in the area of the mods for open circuits (dry joints) or solder shorts.
As the FET preamp was changed, something to try if the fault returns is if the receiver still works normally with an external antenna plugged in? If it does, then the problem could be in the bias feed to the FET (say perhaps R102 open circuit?).

Best wishes, John.

The 1103 is working very nice!. No malfunction observed.
The 25 meter long randomwire is being used with a 9:1 balun at
the far end of the coaxial cable. (used to match my Kenwood R600).

Nevertheless, since it has always overloading the Degen
front-end, now with the preamp FET now working, again, another
ferrite bar was added near the receiver, with primary as 12 turns of
plastic enameled wire to 5 turns. Matching is OK. The receiver
is really sensitive with the FET!!!

Still don't know what happened to cause the malfunction...
but its fine reception is a pleasure...

930. FM works ok, no AM or Shortwave

Yahoo group: de1103
Date: 2007-01-15 20:52:58 UTC
From: Mark Martindale
Topic: 930 Message: 930

I was using my 1103 yesterday on AM and it just quit working on am and sw. It was running on batteries and the rod antenna at the time while sitting on a table.

I searched the previous posts for a fix and tried the reset and master reset. It came on for a couple of seconds after the master reset and then quit again.

I noticed that post #870 sounds like the same problem. Could someone tell me what number transistor is usually the problem and a suitable replacement available in the US.

I appreciate any help,

Mark

enter the frequency using the number keys then press the band+ button
in the lower right hand corner.

934. Re: Ac Buzz

Yahoo group: de1103
Date: 2007-01-17 08:07:27 UTC
From: Bill
Topic: 897 Message: 934

This is an update. The outer skirt is indeed the ground. I bought some 1/8" mono plugs and used some speaker wire I had laying around. I ran the wire all the way around my room (making a loop) where the wall meets the ceiling. About 45-50 feet long. I soldered it to the tip of the plug. I then soldered a short length of wire to the outer skirt. then attached it to a ground rod outside my window.

My first impression was what a difference. Signals were much stronger on shortwave stations. And the problem I was having with the AC Buzz from the power supply was gone. Then I scanned the various Amateur Radio bands on SSB and found that this radio has a problem with overload on the frontend. The voices come out garbled on strong signals. Now if I switch local\dx to local it is not as bad but if I am monitoring a conversation where one of the stations is weak I am left hearing a one sided conversation. However this is a great improvement as the AC Buzz is gone. This should hold me over till I save up enough to get a TenTec RX-340 or maybe even a TenTec RX-320D.
Anyone have any evperience with Either of these?
My Thanks to everyone who gave input.
Bill

I do not know how to receive 8152 mhz as the bands seem to skip this
frequency. Any suggestions fof a novice?

Try entering the frequency directly with the numeric buttons - 8152 followed
by BAND+. Then select SSB and tune the signal (Fine Tune control) until it
becomes intelligible.

Hi Bill and thanks for the reply. I found the Ebay seller and ordered 100 of them. Hope it fixes the problem. If anyone else needs one of these FET's, I will be happy to share.

Mark

As for the RX320, I sold mine a few months ago. It
was the original model, not the D version. I was
quite disappointed in it. The KA1103 is vastly
superior IMHO.

From: Chris
Topic: 940 Message: 940

Hi my name is Chris and I live in Southend-on-sea UK.
I have been into radio listening for about 37 years and
hold a british amateur radio licence, G8LVK.
I own several radios, IC-70R, FRG-7, DX-394, SSR-1, HF-3,
R861, IC-R7000, AX-700, FT-736R and now the DEGEN-1103.
The DEGEN-1103 is not on open sale here in the UK. So I
had to wait for one to come up on Ebay at the right price.
I found a Block Diagram on the web and have put it up on the
Files section. Hope this is of some use to the group.

I also have an original RX320. There MUST have been something wrong with yours. There is no comparison between the two I have. The 1103 is a fine radio but will overload if you hook up a "real" antenna...

I was never overwhelmed with its performance. Hooking up an external antenna actually lowered the performance but if I clipped a longwire to the whip, things improved so yes, something may have been wrong with it but it was that way since I bought it in 1998 or so.

Without using a "Really grounded" soldering iron and all sorts of precaustions during solderings you may ruin those statistic sensitive replacement FET transistor(s) as well. This will explain why they use expensive "soldering stations" in the production lines rather than using "cheap" irons bought from the dollar stores ! Hope this is not your case.

I got one engineering unit from China by a special channel.

The key point to use this active antenna is place the MW unit and the amp unit close to the window or somewhere in room can get the good signal reception, don't simply put it on desk with your radio together, this is the purpose of 15 feet length cable also. Obviously Tquchina doesn't describe this very clear.

From: dgunderwood
Topic: 953 Message: 953

Am I missing something? On the back of my KA1103 it says FM 76-108, ok, I can see that. However, also on the back, it shows AM 100-29999. In all the reviews it says it has LW from 100 to 519 and also says SW is continuous from 1.71 to 30 mhz. I can not find LW (100-519) on my radio nor can I find anything between 7500 and 9000. That does not appear to be continuous to me. Is there a switch somewhere I am missing? I will be very happy to be shown as ignorant if someone can show me how to tune those additional frequencies.

Thanks in advance for any help.

Just key in 100 followed by BAND+. You will then be able tune up from 100
kHz using the tuning knob.

Leon

955. Re: Long Wave and Continuous Coverage on KA1103

Yahoo group: de1103

From: Theo
Topic: 953 Message: 955

It's continuous in the sense that all frequencies are accessible by key-pad entry.

Using the manual tuner, shuttling through frequency ranges will "loop" you back to the start or end of the "band" shown in analogue form... i.e. if you key in "9950" and tune higher, the receiver will skip back to "9000" when you hit "10000".

However, if you key in "10001" then use the shuttle, it will take you through all the intermediate frequencies past the start of the 25m band analogue readout (11450) all the way through to "12450" but then loop back to "11450".

Longwave isn't one of the analogue bands, so you have to start with a key-pad entry.

TD

below 520khz you have to enter the frequency then push the band+ button. so if you enter 100khz via the direct entry button then push the band+ key you will be able to scan all over the longwave spectrum. the knob will not take you down below 520khz.

958. FET protection diodes

Yahoo group: de1103
Date: 2007-02-01 22:07:23 UTC
From: gls_44
Topic: 958 Message: 958

Just installed the fet protection diodes from kiwa, and my ka1103 still works (my first ever radio mod)!! I had noticed a lot of these radios getting fried by static electricity on the forums so I ordered the diodes at the same time I ordered the ka1103 (my first shortwave radio). The radio arrived a few days before the diodes so I have been using it since then. WOW! This thing recieves am/fm better than my GE superadio 3 that I've had for 13 years! I was really worried that I might ruin it and almost didn't do the mod. Now that it's done and everything works fine, I have a little more piece of mind. I also noted that it is the IV model when I had it apart so it should have most of the problems of the older models taken care of. I LOVE THIS RADIO!

Interesting read. I never heard of protection diodes. Kinda makes you wonder why they didn't just put the darn things in the radio to begin with. I am curious where you get fet protection diodes and where did you attach them? If you make a schematic please upload it to the files section that would be really neat:)
Thank You
Bill

Sorry I couldn't enlarge the photo or get it to download into files.
It's a pretty simple mod (if I can do it, you can). Just call Kiwa and
they will send you the diodes w/instructions for $6.00. Remember this
will void your warranty!

963. External antenna, etc.

Yahoo group: de1103
Date: 2007-02-03 17:30:01 UTC
From: n1aep
Topic: 963 Message: 963

Hi from the Boston area. Just got my 1103 a couple weeks ago. It seems to be very sensitive on MW. I have had less success on SW -- lots of noise; perhaps I am just in a noisy area.

Yesterday I was listening to some 20 meter SSB. The signals weren't very strong with the telescoping whip, so I decided I'd try the external wire. Unwound it across the floor and plugged it into the jack. Much to my surprise, the SSB signals I had been listening to got swallowed up in noise. In fact I couldn't hear any hams at all. Tried 40 m cw band, and 75 meters where I was listening to an ongoing AM qso previously. Nada.

I would have thought that the much longer wire antenna would have resulted in stronger signals. I disconnected the wire, re-extended the whip and could receive the hams again.

There seems to be a lot of noise around 3.5-3.7 MHz, and it is very difficult to pull out any 80m signals even at night.

Any comments as to why I got worse reception on a much longer antenna? And would it be better to just alligator clip a wire to the whip?

My previous rcvr was a Sangean ATS818 and other than on MW and FM it doesn't seem like the 1103 does as well. Maybe it is just more sensitive to noise?

Final question: Has anyone set up a connection so that a coaxial line could be run to the external antenna jack? I'm trying to figure out a way to run shielded, grounded feedline to an outside antenna, thinking that much of the QRN is coming from inside the building (computers, modems, lights, TVs, etc.).

Thanks,

Joel

I had the same problem. For me it was an AC buzz coming from the power supply. If I ran it on batteries the buzz went away. I emailed Kaito USA and they replied saying I should use it with the batteries only lol. So thinking maybe a ground would help, I built my own antenna and ran the skirt or ground of the plug to a ground rod. The buzz is gone but now I am experiencing frontend overload. This radio was not meant to be hooked up to a real antenna I suppose. I have to use it in Local mode. I am happy with the results as it has killed the Buzz problem I was having. You can read about it starting here.
http://groups.yahoo.com/group/de1103/message/897
This is only a temporary setup until I have saved up enough to get the Shortwave radio I really want. If this is not your problem then check the normal culprits. Start unplugging one thing at a time. Not just turning it off but totally unplugging one thing at a time until the noise goes away. Most likely it is the TV or the Computer you mentioned. Also you should try to get the antenna off the floor. I ran mine around the room where the wall meets the ceiling. The higher the better of course.
I hope something I have mentioned helps.
Bill

> Any comments as to why I got worse reception on a much longer
antenna?
Seemingly it picked up more noise than signals. (The longer the wire
the better the capability to pickup noises inside the house !)
> And would it be better to just alligator clip a wire to the whip?
>
Try it nevertheless but dont expect will make too much different.
> My previous rcvr was a Sangean ATS818 and other than on MW and FM it
> doesn't seem like the 1103 does as well. Maybe it is just more

Yes, sensitivity is a two way street. It pickup noises as well as
signgals --- QRM and QRN as well.
>
> Final question: Has anyone set up a connection so that a coaxial
line
> could be run to the external antenna jack? I'm trying to figure out

The tip of the antenna plug to the outdoor antenna wire/feedline and
the collar to the shield of the cable. More importanly a good
grounding to the cable shield outside the building will be very
critical to avoid noise pickups ! However overloading the DE1103
front end will be unavoidable for most powerfull stations. --- adding
an attenuator between the outdoor antenna and the DE1103 may improve
the reception somehow. On the other hand, as people mentioned in
this forum, chances for electro static charges (e.g.
thunderstorms ...) may burn out the receiver frontend is much higher.
Hope these helps.

Hi Joel,

Yes, noise is from junk in your house. Just take a walk out your driveway and I bet S/N goes way up. I live in Uxbridge, just south of Worcester and I got the same problem. There are a few shortwave stations that I can get, but not many. I'm in Rochester, NY, on a contract job at the moment in an apartment building and SW is totally useless. I catch what I can on my walk to work. Best time to drag the portable out for indoor use is when the power goes out. You can do a survey of the house and see what appliances are causing disturbances. Worse ones I found besides TV sets and computers were microwave oven and electric toothbrush charger. Make wife and kids 'rig for silent running' at 10pm is only advice I got for you.

Here's another option for the protection diode issue and doesn't void
the warranty, while adding an RF gain control.
Here's the link:
http://homepage3.nifty.com/jh5esm/handmade/de1103accessories.html
Cosy uses 1N60 diodes, germanium diodes but I'm not sure that a 1N914
/ 1N4148 wouldn't work too. I'll probably end up using 1N34's (Ge also).
I thought his design was pretty ingenious and if you're a ham and
going to use it with a transmitter, tuner, etc. this will give you a
place to mount your favorite kind of connector - BNC, SO239, etc.
I'm not knocking Kiwa, I know their mods are good but for $6 I can buy
a LOT of diodes...

It is amazing how well this thing receives. I was listening to 40
meter CW and 75 meter SSB in my steel sided house with the whip antenna!!
I wasn't so sure about this radio before I bought it. I didn't think
the tuning would be fine enough, etc. And I'm no expert either but I
do know when the front end of a radio is way too broad (as in older SW
receivers - table top or portable). This guy is pretty neat. I think
it will do me fine for bench work and as a receiver to simple
transmitters (I bought the NE SCAF filter kit and a Vectronics filter
kit as well).

Even though I do not live in a dry country where
static charges would easily build up, I have
installed two 1N4148 Si diodes inside the 3.5-mm
antenna plug. This will protect the famous FET as
long as the plug is inserted in the antenna jack
first and then the external antenna connected to
the plug. This should be enough to protect the
front-end from a static charge. Of course do not
expect it to protect your receiver from a direct thunderbolt strike :-)

Also, it will not protect the FET from voltages
applied to the telescopic antenna.

From: thinkytony
Topic: 973 Message: 973

Hi All

I bought a brand new DE1103 not so long ago, and impressed as I am, I'm appalled by its short battery life. The supplied 1100 mAh rechargeables are only giving me three or four hours listening time, or alternatively about week on standby before the batteries are completely flat. A set of brand new Duracell's perform a bit better, but not much.

What on earth is the unit doing to flatten four fresh AAs in a week just to run a LCD clock?

Is this the kind of use other owners are experiencing.

Cheers,
Tony.

I'm afraid that your experience duplicates mine.
I get about 8 hours run time with a set of 2100 mah recharge ables.
Alkalines don't fair as well.

But still, it is a nice radio :)

Cheers

First off, are you charging the batteries in a stand alone charger? You will get much better performance using a smart battery charger that monitors each battery individually as opposed the the dumb charger in the radio that only uses a timer for all four batteries at once.

2ndly, try using 2000 mAh or better with this radio because it's known to use a lot of juice. I'm using 2500 mAh Powerex batteries along with a MH-C401FS smart charger on the slow setting to ensure a maximum full charge.

With limited use of my DE1103 radio (usually for an hour and a half on Sunday evenings) my batteries run for a minimum of 3 weeks before going flat.

I have a DE1107 radio that I use at work daily, and along with a set of Degen 1300 mAh batteries I get about 7-8 work days of use before they go dead. With Powerex 2000 mAh I get better than 2 weeks of use. Keep in mind that the batteries are also being charged my smart charger. The slow charge is safe for the Degen batteries so they won't get fried.

I pulled the doggone antenna apart on my Kaito as well. The thing just flew apart when I pulled it out. I'm wondering if the cold WX has anything to do with them failing. We've had a few cold spells here in Rochester, NY over the past two mos. So be very gentle when you whip it out during cold WX that it doesn't break off on you.

Anybody else have this happen?

I'll have to order a few of those antennas.

This may be a completely unhelpful comment, but for what it's worth, I put a set of regular alkaline AA's in my 1103 when I got it and they've lasted next to forever. I do leave it plugged into the supplied external power supply just about all the time and only use the batteries when I take the radio away from the bedside and use it elsewhere, but the battery-strength indicator just always stays on the all-bars "full charge" indication when I adjust volume. Maybe it is worth trying that approach?

An interesting side note -- the Kaito power supply is also the right polarity, voltage, and plug size to fit a tiny Radio Shack hand-held TV and the Sony ICF-7600GR SW radio, so I'm getting multiple uses from that accessory.

980. The Curse of the Frozen Radio

Yahoo group: de1103
Date: 2007-03-09 12:13:52 UTC
From: john_cribbin
Topic: 980 Message: 980

There have not been any posts on this subject in many months now. Have we ever got to the bottom of why these radios sometimes lock / freeze up?

I've had mine for about 15-16 months now, for the first 12 months it only locked up 3-4 times and was quickly cleared by taking the batteries out for a few minutes to a few hours.

I'm now in the position where for the past month or so, it lives in a semi-permanent state of suspended animation. the LCD goes blank and none of the keys respond. The only way to get it back is to remove the batteries and then use the reset button. This brings back some life in the display and as the reset button is held down the display fades until it is fully gone. Then the batteries can be re-inserted and the radio work normally. But I guarantee that once it is switched off for the night it will be dead again the next time I come to use it.

It makes no difference if it is powered by mains, alkaline or ni-mh batteries. It seems as long as power remains in the radio, then this fault will re-occur and remain until any residual power is discharged.

Clearly something has changed inside the radio recently - but what?
All suggestions gratefully received.

John

Mine often locks up when the batteries are changed, resetting fixes the
problem. Memories are left intact but the clock resets.

I had this problem only once while changing batteries, and resetting
the unit cured the problem. Mine is a Mk IV, design and have had it
for a few months.

I rarely use regular alkaline AA's because they cause the LCD display on my DE1103 and the clock on my DE1107 to seemingly overload. All the pixels appear darker and some that shouldn't be lit up appear light grey. It seems I'm the only one that has experienced this problem. Near as I can figure, the AA NiMH rechargeable batteries are 1.2V and the regular alkaline AA's are 1.5V and it's that slight difference in voltage that causes the LCD display in my two Degen radios to show ghost images.

It's kind of odd, because I use regular alkaline D size batteries in my Tecsun BCL 3000, and the LCD display is perfect.

John,

Software lockups fll into two main categories; Frequent or Extremely Infrequent. Generally, if a radio locks up, say once a year or less it is probably ok, but if it freezes up with any regularity, as you are reporting, something is amiss that should not happen.

The only thing that can play a big part here is static electricity. I don't' know where you are located, but here in Northeastern USA out winters are extremely dry, and static electricity indoors is a serious problem. You are continually zapping the radio with static bursts as you handle it and use it, especially if you are moving around a lot. Some radios may be more sensitive than others to this static without being truly defective. Unless you are in a relatively humid climate you should take some steps to minimize static the radio has to deal with. Unless you can control the humidity, such as with a humidifier, you should try to discharge any static charges you have accumulated on your body prior to touching the radio. You can discharge the static by pressing your hand firmly against almost any large solid surface. Of course metal is ideal so if you are near something that is grounded you can touch that first to discharged. But even a regular old wall will conduct enough at these potentials it just takes a few seconds. Just press your hand against the wall for 3-5seconds and you'll see when you touch the radio...no zap.

That might solve your immediate problem.

Jay

985. big batteries crash hard?

Yahoo group: de1103
Date: 2007-03-16 16:22:06 UTC
From: yzordderrex2003
Topic: 985 Message: 985

I bought some large capacity batteries off the net a few weeks ago. They seem to crash hard. I mean that I will look at the battery indicator and I got 8 or 9 bars. A half hour later the radio is shutting off cause the batteries are dead. The batteries that shipped with the radio seem to have a much more gentle slope when discharging.

Anybody else notice this?

regards,
NEO

Seemingly either your "large capacity batteries" are defective or intensionally MIS-labeled as large capacity ! Otherwise you may not charge them sufficiently -- to their "full" capacity --- before puting them in the DE1103. Please keep in mind the larger the capacity the longer the time to fully charge them . On the otherhand after using them for awhile take all out and measure each battery's voltage one by one. (A defective one will shown less than 1 volts -- or even "Zero" volts !) Hope it helps.

http://tinyurl.com/2xr55h

Here is a graph for AA cells in various chemistries. Alcaline batteries have the most gentle slope. NiMH batteries usually run near full capacity and then die off quickly. The Degen 1300 mAh I have die off pretty much the same as the Powerex 2300 mAh batteries, but they don't last nearly as long.

Interesting material. Assuming you created these graphs yourself,
what was the test setup..specifically the load or current drain?

Thanks,
Jay

No, I didn't create this graph. I just posted the link.

When you view the graph, there is a link in light blue just above
saying "please read how these tests were done".

990. Using the DE 1103 as Test Equipment

Yahoo group: de1103
Date: 2007-03-18 17:15:25 UTC
From: John Kinnunen
Topic: 990 Message: 990

Greetings to all,

I have somewhat a strange Question. I have a DE 1103 and want to use it to align a new CW Transceiver I am building. Case in point is the 15 MHz oscillator. Here is what I have done so far. I have a generator that I can set to exactly 15 MHz. I put the antenna of the 1103 buy the generator and set the Freq. at 15 MHz on the radio. Then I adjust the Fine adjustment until I zero beet the sound. Without readjusting the radio I move it so the antenna is close to the new transceiver and adjust the 15 MHz. oscillator to also zero beet. I think I am doing everything right with this method, but my question is.

Is the Fine adjustment exactly the same as a BFO or is or is this just a fine freq. adjustment and there is no BFO setting or what?

This is a method that was stated in the manual of the CW Transceiver, however, the only radio I have that comes close to having a variable BFO is the DE 1103.

Any help in this mater would be very much appreciated.

This is a method that was stated in the manual of the CW Transceiver, however, the only radio I have that comes close to having a variable BFO is the DE 1103.

Any help in this mater would be very much appreciated.

The fine adjustment is a conventional BFO, at the second IF of 450 kHz.

Your method will work fine. using SSb mode will allow you to get the 15 MHz setting right on. Fine tuning the oscillator's frequency is similar to fine tuning SSB.

-I have a weak Q1 in my 1103 after a couple weeks use. When out of
the box the sensitivity was unbelieveable. I hope to get the
performance back up to par.. I am tryin to get the main board
liberated from the case. My unit has the board, connectors, and
knobs somewhat sandwiched into the case with no obvious relief for
removal. I am wondering how this was done by you guys who have done
it. Certainly you didn't bow the board to get it out?

Topic: 996 Message: 996

it is written that 1103 has 268 memories but the lat memory is FE ie
255 memories . where is the rest "the 13 memories "?
my second question is about the telescoping antenna. it was removed
from the radio but i could put it again by pushing it into its place
strongly . i that normal or the antenna is broken?
i have another 2 questions about ka11
i dont know how to convert the temprature from f to c and vice versa .

in the maual of ka11 you can see at the photo of the display the
word "bass" just under the stereo sign you can also see at the bottom
of the diplay the words " fast" "slow" and "volume" under each of
these words ther is an arrow head.their is no word about this in the
manual.anyone know anything about that please tell me thank u

12 memories are used for each band. One per band - to remember the frequency that you programmed before moving to another band. Not sure what the last memory is - unless the radio goes to FF...?

I am not sure about your antenna question... However, make sure to find the wire inside the radio near the antenna connection. The screw should go through the ring of that wire. I use a small probe to center the ring lug over the tapped hole that secures the antenna.

That should not happen. The screw that allows the antenna to pivot should stay in place. If you have the screw and it continues to fall out, consider Loc-Tite (Thread Locker) or Super Glue to secure the screw to the thread. What could be happening is the screw is turned when you move the antenna around. If the screw is not secure, then the movement will allow the friction to turn the screw.

If you use this method (Loc-Tite), do not tighten TOO much. Loc-Tite can be found at automotive stores. If it not available near you, find a similar non-permanent adhesive for screws. Super Glue may not adhere as well to metal as well as Loc-Tite. And it is not as soft. Loc-Tite allows you to change the screw easier while it cures.

Best Regards,
Thad

12 memories are used for each band. One per band - to remember the frequency that you programmed before moving to another band. Not sure what the last memory is - unless the radio goes to FF...?

I am not sure about your antenna question... However, make sure to find the wire inside the radio near the antenna connection. The screw should go through the ring of that wire. I use a small probe to center the ring lug over the tapped hole that secures the antenna.

I'm not sure locking that screw in place would be a good idea. If you ever have to change out the antenna, you're literally 'screwed', pun intended. I was having an intermittant problem with my 1102. I kept taking it apart cleaning it with De-Oxit and screwing it back together. After about three times of doing this (the problem kept coming back, and I just love resetting the MW spacing and the time format in the nano-second after you put the batteries in), I deceided to try some thing different. I went through my junk box and found a tiny lock washer (the kind with external feet) and slipped that between the washer with the antenna connection and the antenna itself. It took some patience, but I eventually got it. It seems to be working so far. Jerry.

Don't forget - there are two screws on the antenna.

I guess I should have been more specific about non-permanent. Thread Locker (222) is low strength, removable thread locker. I would recommend Loc-Tite over SuperGlue for this application any day, but some people might be a little reluctant to buy a specific adhesive. I am not sure of its over-seas availability.

To be thorough, a lock washer would be a good choice for mounting the antenna to the radio wire. It would pervent the screw from backing out. The pivot of the antenna, however, is a part that moves. Securing the screw threads to the stationary part allows the rest of the antenna to pivot without the screw backing out. I believe that koreish was refering to the second one, but felt the need to comment on both, just in case.

SIDE NOTE _ Here is a hint for screws in plastic: When you tighten the radio back up, turn the screw counter-clockwise until you feel the screw drop slightly. Then turn the screw clockwise. This allows the screw threads to follow the cut threads in the plastic. This method allows you to open and close the radio numerous times.

This post is interesting only because I just finished re-assembling
my 1103 after replacing Q1. The whip antenna should have two copper
washers installed sandwiching the moveable antenna flange before it
is slipped into the pivot posts. The screw does not turn. In fact
it has no force on it. Its only purpose is to preload the
springyness of the pivot posts. I lost one of these copper washers
and could not get the antenna tentioned tight enough to keep the
antenna from wabeling around. You NEED these two washers. IF you
have lost one or both then you will have to get creative and
replace with something else suitable to take up the space..
Good luck,
Al

1006. outdoor antenna.

Yahoo group: de1103
Date: 2007-04-01 14:28:29 UTC
From: profilenameistaken30
Topic: 1006 Message: 1006

Does anyone have any thoughts on building an outdoor antenna and soldering the connection to 1/8 inch audio plug. There are obvious concerns with overload and static. Not being able to afford a high end table top receiver I would like to get more dx than the 1103 and ka33 active antenna allow.
thanks.

Thanks Thad for the screw in plastic case tip. As far as the Thread Locker 222, I've seen it on Amazon . A 6ml bottle goes for $5.49. It is a good idea for that pivot screw, especially on the larger portables when they inevitably start flopping around like on my ATS 803 and always hitting me in the head. So far my 1102 has been ok and my 1103s haven't had any antenna problems. I think the Loc-Tite will be worth a try if they do. Jerry.

1008. Re: [de1103] outdoor antenna.

Yahoo group: de1103
Date: 2007-04-01 23:57:09 UTC
From: Moisés Knochen
Topic: 1006 Message: 1008

My only experience is using a 15-meter (about
50-foot) randomwire antenna (height about 3
meters or 10 feet, suburban area), connected
directly to the antenna jack of the receiver.
Despite the frequent claims about saturation of
the front-end of the receiver, I did not
experience any noticeable problems. My receiver
is a Degen DE-1103 Mk IV, may be this version has
an enhanced front-end but I don't know.

As to protection for static charges I have
installed a couple of 1N14148 silicon diodes
(connected in anti-parallel) between center and
sleeve (ground) of a 3.5-mm (1/8") miniplug. Tha
plug is connected first to the receiver, and then
the external antenna is connected to the plug via
a bananna jack and plug. This arrangement should
provide protection for static charges accumulated
in the external antenna, as the voltage between
"live" and ground if the antenna input is limited
by the diodes to about 0.6 Volts. However it will
not protect the telescopic antenna.

Also it will not provide protection against
lightning, but that is an entirely different matter.

I also tried a 9:1 "magnetic" balun transformer
but the results were poor so I abandoned it.

Enhancements that I did not try but would be
interesting to experiment, include different
antenna transformers and a continuous attenuator (i.e. a potentiometer)

Besides that, while at home in the city I use a
chinese TG-34 SW/MW active-loop antenna which
provides a reasonable enhancement in sensitivity
for several bands (mainly 49 to 19 m)

73,

Moisés

Mmm... I use 25 m of longwire and overload is present if a balun is not inserted.
Moises, are you sure the FET at the frontend of your radio is OK?
As you know, I experienced the FET being burnt by a nearby lightning,
and the receiver didn't silence completely, but there was an obvious decrease of
sensitivity. I'm starting to think that maybe the unit you bought already
could have the FET out of order. Maybe I'm wrong, but your comments
now make me think about this possibility.

In my case, I need not only a 9:1 balun but had to add a second ferrite bar
transformer to have a better match. This means my unit is much more sensitive
than mine?

Yes Horacio, I share your doubts, and as I told
you once it would be interesting to compare your
receiver with mine side by side - this is an invitation :-)

As to the 9:1 balun, I was surprised about its
meager performance with both DE-1103 and Sony
ICF-7600DS receivers, but of course there is the
possibility that mine was poorly built - patience
is not one of my virtues :-) :-)

Also may be I am a bit too tolerant about birdies
and other symptoms of front-end overload. Only
experimentation could take us closer to the truth.

Hello to the group

tquchina (also a honourfull member of this group) is offering now
original encoders as spare parts.

Before I bought here in Germany ALPS STEC11B04 from a company
www.Conrad.biz under part number 700698. The axle must be shortened
according to original encoder. The part has function in my DE1103.

Perhaps this may help too.

Note:
No german radio dealer is supporting parts/help if the radio is
bought direct in China. The official importer is checking the serial
number (telephone information).

Regards to the group

Kurt,
How long has your ALPS encoder been working? I too, used a shortened ALPS encoder, but my de1103 still freezes once in a while. I am still debating the cause of it and I won't know until I run some wires from the encoder connector to the outside. When I get around to it...

I bought my radio in July 05, so it probably qualifies as an older de1103.

Thad

Interesting info, Kurt. Depicted in tquchina's
webpage at ebay are two different styles of
encoder, one with aluminum axle and a different
one with a plastic one. My receiver (purchased
directly to Degen on October 2006) has the
plastic version so this spare would not work should I need it.

Does somebody know if the encoder with the
plastic axle is the chinese one (reportedly prone
to fail)? If so, it is bad news to me. I thought
that the Mk IV version was the latest one which
supposedly carried the Alps encoder, but now I am not so sure. Any comment?

Regards,

Moises

From: Vieth Kurt
Topic: 1014 Message: 1016

Hello,
fine, that there is interest to this.

Regarding to the discussion, i try to give some answers:

-My DE1103 is from August 2005 (from Liypn on ebay/china), (Thad Larson bought in July 2005 from Degen direct)
-the encoder has an aluminium axle,
-the encoder is labeled with something like an "S"
-I tried to repair/clean the part three times. There were many silikon grease inside. After the first time it runs some weeks. After the third repair the little "fingers" gets smooth from bending. After this third time in a section of 90° turning the encoder was jumping between two numbers (7-8-7-8-...) and i gave up.
-My intention was to get a spare part. From German dealers my comment yesterday. ALPS encoder normally minimum package 1000 units... So the Conrad-Shop is known in europe (www.conrad.com). But they have only the version with the long axle (comment see yesterday). If someone is interested in technical details it is possible there to download the data sheet (for our file section??). (www.conrad.biz then in the field "suchen" the part number 700698-29 and then "Datenblatt") and it must be possible.
-Price: 3,79 Euro + transport...(but remember, you must shorten the axle...)
-this spare part encoder ALPS is marked: ALPS, Made in Japan and has an aluminium axle too!!
-The dimensions and the electrical contacts of the encoder are 100% identic to the original equipped part in the "DE1103-Summer-2005-version"
-I exchanged the encoder original against ALPS last week, So i have no longtime experience (but I'am lucky that this lovely small radio is working perfect again...)

It is simple to exchange this part:
-open the housing at the antenna side only 3cm,
-white flat cable out of the socket,
-cable to the encoder out of the socket, solder away the ground line
-open the housing complet
-loosen the nut on the encoder axle
-carefully bending with a small pliers the plastic housing and take out the encoder (it is no need to disassamble any pc board from the housing)
-soldering the three lines to the new encoder and reassembling.

1) I can not answer when the plastic axle encoder started in production.
It would be fine, when our member Tquchina would give an answer.

2) I don't know eather if the electrical contacts/electrical data to new and old encoder were similar. Tquchina says on his ebaypage: not identic, but is it possible for someone in the group to lay a photo of the new encoder in the file section? Or could someone analyse the technical difference? Who has both DE1103 versions,open them and make photos in comparison?

3) I don't know, if the new "black-plastic-axle-encoder" in the DE1103 are more stable.

Perhaps some of my answers seems for some insiders a little bit idiotic, but it seems for me too, that this spare part was difficult to get (until yesterday...).
I do my best, but please appologise my simple english.

Best regards - let's have an interesting discussion!

I just placed two general views of the old jog dial.
Files \ Jog Dial Internals

I figured that the externals should be added so that you know which internals go with which encoder. I don't have the encoder used by the newer de1103.

I also used the ALPS ec11 type encoder. The type that you used looks like a better alternative than what Alps has here. In the states, the ALPS datasheet shows vertical encoders WITHOUT threads. The horizontal ones have threads, but I was overly-cautious about something shorting out.

From: lgpond
Topic: 1018 Message: 1018

I got a DE31MS with a DE1103. It really doesn't do much. The tuning wheel and the on/off switch do not seem to make any difference. I tried it with a RS 399 and I get SW reception similar to a wire attached to the external antenna jack with a 1/8" plug. How does your DE31MS work?

I don't have the DE31MS, but I do have the TG34 which is basically the
same thing. With shortwave it definately works better than a plain wire
and you should easily be able to tell when the tuning wheel is tuned
right for each wavelength.
AM is a different story. The nearest AM station to me is over 110
miles and the antenna just pulls in more static, but I can still tell
when the tuning wheel is tuned because the static gets much louder.
Sounds to me like you have a broken connection somewhere in your unit.

1023. NM-139?

Yahoo group: de1103
Date: 2007-04-14 15:38:59 UTC
From: Moisés Knochen
Topic: 1023 Message: 1023

eBay seller tquchina is selling some spares for
the DE-1103 radio, such as telescopic antenna,
folding back stand and replacement encoder, as
has been discussed previously here. Now that
store is also selling a NM-139 module, advertised
as "NM-139 AM IF / SSB BONDING IC". It is small
piece of printed circuit board with (apparently
from the picture) two active components and little else.

I wonder whether that part is prone to
failure, perhaps somebody can tell us if he/she
has had some problem with it? So far I hve never
read reports of electronic failures besides fried Q1s or bad encoders.

Regards,

Moisés Knochen

Hi everybody, I'm new to the group and to shortwave radio. I just got a KA1103 and I'm hoping you will indulge this very basic question. The KA1103 comes with a longwire antenna (as I'm sure you all know). My question is how do I use this? From what I've read in Passport, portable shortwaves are supposed to be able to function quite well with their built-in antennas. Yet if this external can boost signals even a little I'd like to try it but I have really no idea how to go about setting it up properly and safely. If anyone could help I'd appreciate it. Thanks in advance!

From: Dennis Gibson
Topic: 1027 Message: 1027

I've spent some of the last few weeks reading reviews saying the KA1103 is the greatest thing since sliced bread. Well guess what? It is! Mine arrived today and I am absolutely flabbergasted at how good it is. Yes, some of the ergonomics are goofy. They're not nearly as bad as reported in Passport to World Band Radio, which called them "hostile".

I bought a KA1101 a couple of weeks ago and am very impressed with it. But the more I read the more I knew I had to have a KA1103. This month's Monitoring Times compared it to the Sony, the Grundig G5 (aka Eton E5) and G4000A/YB400PE. The 1103 was a very close second. It's really hot off the whip. Tonight I've been comparing it to my Sony ICF-7600GR. The 1103 is just as sensitive and selective as the Sony. I really wish it had synchronous detection but what can you expect for $80.00? I haven't decided which one is my new travel radio, replacing my Radio Shack DX-398 which is deaf off the whip.

As much as I hate to admit it the DE1103/KA1103 does blow the DX-398
out of the water off the whip. The DX-398 has allot of bells and
whistles to play with that the 1103 does not have. But as far as
reception it is with out a doubt the best for the money out there
right now. When I first got it I thought I would hate the ergonomics
but It's not nearly as bad as some say, it just takes a little getting
use to, I would even go on to say that I actually like the fake analog
look, it takes me back in time when I was so-called DX'ing when I was
a kid. My major complaint with my radio is I hear a little chirping
when using the tuning knob relatively fast, especially on the MW band,
there is a mod for that I think.

Hi all,

I've just recently purchased a KA1103 from Grove and generally quite pleased with it. One thing bothers me though. The manual says that its frequency range on AM is 100 - 29999 kHz. But the dial is not calibrated for long wave or the intermediate frequencies, for example,
8000 kHz. How do you tune in long wave or 8000 kHz stations? It's got me baffled. Any help would be appreciated. Thanks.

Sam

Hi all,

I've just recently purchased a KA1103 from Grove and generally quite pleased with it. One thing bothers me though. The manual says that its frequency range on AM is 100 - 29999 kHz. But the dial is not calibrated for long wave or the intermediate frequencies, for example,
8000 kHz. How do you tune in long wave or 8000 kHz stations? It's got me baffled. Any help would be appreciated. Thanks.

You have to enter those frequencies directly with the keypad.

Topic: 1033 Message: 1033

Hi to all! I'd like to have some comments on TG35 antenna... I've a Degen 1103, a Sangean ATS909, a long random wire and a DE31MS antenna...
I've found that the DE31MS has someone better performanche than the wire... the signal is more "clear" and with less noise, especially for DX...
has someone the TG35 antenna? is it better than the DE31MS? have you compared with better antennas like Quantum Loop or Wellbrook or wires?
How for NDB reception or DX in other bands?
Thanks in advance from Italy :-)

I was less-then impressed with the TG35 for several reasons. First, its performance is mediocre at best. With a decent radio like the DE1103 the improvement in reception is very marginal unless you are in a shielded building and need to place an antenna in the window...in that mode it can help a bit. But basic performance is well below the Sony ANLP-1 on SW or the C. Crane Twin Coil on AM. The Quantum loop is even better than the Twin Coil so the TG35 comes out at the bottom of this list.

Ergonomics: A nightmare. TheTG35 contains an internal rechargeable cell (sealed box, soldered in place battery. It can only be charged by the solar panel, from which 10 hours of charging gives about two hours of run time, or via a USB connection to a PC? Who ever thought this would be convenient? My PC is no where near my radios, so if I have a cloudy day I can't use the antenna because there is no DC input jack and no way to run it or charge it from AC or another battery.

To me a poorly conceived product from start to finish. Save your money...there are better choices.

Do you like your DE31MS? How well does it work with the Sangean ATS-909 and the Degen 1103? I have identical versions of both; the Radio Shack DX-398 and the Kaito KA1103.

Is there a difference between a DE31 and DE31MS?

Jay,

Thanks a lot for your so kind comments, please find our answers/comments in the following, FYI.

#1. not the everybody live in a wood built house, so the signal reception is not good for everyone. In fact, many peoples has the problem on the signal pick up because they live in a reinforced concrete built house, so they need the external antenna for the signal reception improvement. In this point, even you use the external antenna in your desktop, how about the performance than place it close to window if you live in a shield reinforced concrete built house?

#2. not the everybody has the dedicated room for the radio listen without any other AC based electronic appliances, so it is impossible to avoid the EMI noise from AC power cord and AC based electronic appliances, this EMI noise impact is obvious on the radio signal reception, especially on the MW band. How to solve this problem? The solution one is stop the all AC power supply. The solution two is use the big size loop antenna and place it close to your window, but by this way, you should make sure this big size loop is placed close to window and is vertical with the window, only this way you can get the better signal pick up, but if this is easy? The solution three is move your radio in the room and find a good position can pick up the signal better, so maybe you need more desktops in your room for the different band and different frequency. The solution four is use the external ferrite antenna and move it in room to find a good position can get the good signal pick up and amp it then input/coupling into your radio, for this way, the window is the best.

#3. most active antenna use the rechargeable battery as the power supply, but you need to take it out from the battery compartment and use the charger to recharge it, some others can works on the external AC power cord, but this will makes the EMI noise. So the TG35 use the solar for the battery recharge. The only action you need to do is place it close to window and can get the sunshine, then don't need to take care of it, just leave it at there, it will be auto recharged. The USB is for the some cloudy case use only, from the feedback from different users, we know it is not easy and good in the recharge mode, so we will continue to improve it in the future products.

One more information here for your reference is the TG35 was designed by a radio designer who designed many good radios, especially for a special model, most people in this 1103 group has one or more this radio in hand already.
Before we make the TG35 online, we did many tests and investigations in domestic already, base on the feedback, we did some modification and then make the decision to make it in mass production and online available.

Anyway, we got the different new feedback from worldwide and all these information are very important and helpful for us in the upcoming TG36 desktop active loop antenna, at least we change the recharge mode and add the new functions on it, we spent about six monthes on it already, we hope it is more better and can be online asap. So we really highly appreciate your comments and suggestions!

The English is not our mother tongue, we are sorry for the any mistake or inconvenience by our input, and we thank you for your patience to read so long words, hope all these information is helpful for you!

Have a nice day!

Tao,

I appreciate your comments...in fact (for the benefit of those here) we have discussed this privately already. I have a few comments to follow up.

1 & 2) I did refer to the shielded building use for this antenna. In that regard it is similar to placing your radio in the window and for that purpose it works decently.I also agree that remote placement can be a benefit, but with a portable radio you may already have that capability. I generally am or enthusiastic about antennas that can improve the reception of an already good radio, such as the ANLP-2 for SW and teh C.Crane Twin Coil for AM. IF remote placement in a window in a shielded building is the ONLY objective for an external antenna it generally is not received too enthusiastically by many users. Most of us liek extenral antennas that provide more signal to nosie ratio than what our radios give unaided.

3) With regards to the solar charging with computer USB charging as a backup I don't see why this is preferable to a DC input jack and adapter for recharging and use. Certainly anyone who has a PC also has an AV source to plug in a charger. In my case, if the unit has no power the ONLY option is to connect it to a PC which si much less portable than an AC adapter which is a severe limitation on where I can use it. If it simply had a DC input jack ADDED to the current design it would be much more convenient in a variety of situations.

Finally, I appreciate that Degen has some very excellent designers...the DE1103 for example proves that. There are several Degen radios I own and enjoy but that is not enough reason to like the TG35 in its current form. If its RF performance could be imporved just a bit more and if it had a DC input jack (in addition to or INSTEAD of the PC USB interface I think it would have more value for many of us. But these are just my opinions...I cannot speak for the world wide market.

Thans for your comments...I do look forward to new products from Degen.

Jay

Well it's a good little antenna... it works decently also in tropical
bands... good performance on both the receivers... not so noisy...

for de31 I've found an interesting post here --->
http://www.drmrx.org/forum/showthread.php?t=1210

If I would a really good antenna I should get a LA5030 Wellbrook ...
but it's really expansive...

>
> Is there a difference between a DE31 and DE31MS?

de31 is only for shortwave, while DE31MS also for medium wave...

This is really interesting... well... I think that the point of reference are the wellbrook antennas... If the performance are similar to these antennas... the TG36 will be the reference Antenna... it should be good if instead of whip you could use a loop (70-100 cm for example...)

That may be expecting a bit too much...the Welbrooks are excellent antennas but cost considerably more than these Degens...not a fair comparison at all.

1044. Replaced Jog Dial Encoder

Yahoo group: de1103
Date: 2007-05-08 16:51:35 UTC
From: yrag4931
Topic: 1044 Message: 1044

I have one of the first 1103's and it was becoming nearly unusable due to the erratic encoder.I have repaired many old transistor radios,so I decided to tackle the encoder replacement.There were two problems for me to overcome:
1.Getting the old encoder out.Due to nearby components the encoder must be removed by pulling it straight up.I snipped and removed a small piece of plastic from the mounting bracket(directly above encoder shaft).There is still plenty of the bracket left to securely hold the new part.
2.Stripping the insulation from the tiny wires in order to solder them. I have wire stripping tools but none to strip such a tiny guage of wire. I also knew from past experience not to use a knife or razor knife because you lose a strand or more of wire in the process.Yes,these tiny wires were stranded,not solid.I almost gave up on this obstacle and just make this a parts radio.Problem solved by burning the insulation away with a cigarette lighter!
Soldering the wires onto the new encoder was much easier than anticipated.The hardest part was holding the wires steady until the solder cooled and became solid.
I bought the new encoder from our old friend Tao Qu and would like to thank him for making this part available.
P.S.
I realize this project could have been done with a lot more finesse,better tools,more time and much more disassembling.But,hey it worked!

From: jdhardin449
Topic: 1046 Message: 1046

I'd like to know how much current the 1103 uses when powered by the stock 1300 maH batteries. It's a little tricky getting a sandwich of aluminum foil/waxed paper/aluminum foil between the batteries (my usual method). I will use this to calculate when and how long to recharge. Am I correct...the stock charger is current limited at 100 ma?

Topic: 1046 Message: 1047

Interesting exercise, how do you plan to calculate the actual charge duration required? Since you are measuring, could you measure it under different drain conditions, such as backlight on/off, volume at 10/20/30/40 etc.

I use the radio for SW , on the internal speaker, with the volume at
about 12, telescopic antenna, no backlight.
To answer how I would use the information... if it usually draws say
300 ma and I use it for an hour, I would need to charge it for 3 hours,
(assuming the charger provides 100 ma) to get back to the same energy
in the battery I started with.

1049. help with FM frequency tuning step

Yahoo group: de1103
Date: 2007-05-10 17:33:36 UTC
From: Amogh Desai
Topic: 1049 Message: 1049

hi im using DE1103 for a month now..
but i see tht the tuning frequency of FM goes up eithr bt 0.2 or 0.3 MHz
i.e if im at 93.50 MHz >> if i start tuning upwards it 1st goes to
93.52 then the next step is 93.55 .. i dont like tht
can i change it to linear 0.1 MHz tunning step???
plz help

1050. Re: help with FM frequency tuning step

From: nelson1379
Topic: 1049 Message: 1050

I believe that when it says "93.52" it actually means "93.525" and
"93.57" actually means "93.575." So the step is consistently 0.025.

--- In de1103@yahoogroups.com, "Amogh Desai" <desai_amogh@...> wrote:

Yep, any radio needs to be disconnected even from a grounded external
antenna when there's lightning about. Sorry about your loss...

I also had skipping encoder problem on my April 2004 unit until few months ago. It was fixed it by spraying 3M contact cleaner, with the tube-end of the spray pressed directly on the side crevices of the encoder. The general idea was to force some fluid into the encoder. Seemed to work OK after some vigorous spinning. It still skips a little bit but it's at least 90% better than it use to be.

The Sony 2010 is also very susceptible to getting somewhat fried when lightning is out there. Fortunately out here in California we don't get much of it.

I would add: disconnect also the AC power supply for the receiver, besides the antenna.

Transient voltages are also a risk via the power lines.

One fine point about charging batteries is that the process isn't 100
% efficient. You need to put in about 40% more ampere hours than you
had drained out. So in your example you would need to charge for 4.2
hours. I guess the rest goes into heating the Ether!

From: Eric
Topic: 1064 Message: 1064

Hi All,

Just received my new DE1103 today. I am charging the batteries with an external battery charger and am thus running the radio from its supplied 220v power pack.

While I still have to explore the full functionality of the set, I must admit I'm a little disappointed with the FM performance of the radio, using the telescopic antenna. Here, I am comparing it to the performance of my Sony SW7600GR, also on the FM band with telescopic antenna. The Sony outperforms it on weak signals by far. I also do not find any difference in sensitivity with the Local/DX switch settings, so presume this is for AM use only.

Realising that the Sony costs nearly three times the price of the DE1103, am I expecting too much from this receiver?

I've had my 1103 for a couple of years and find that the FM performance is outstanding.

I live in Los Angeles, which has very crowded bands, but the selectivity and sensitivity of the 1103 is excellent. It certainly is better than my Sony 2010 receivers, and it's in stereo.

Tinny or weaker and tinny? I haven't compared the 7600GR and KA1103 on FM.

I just got a Degen DE31 active antenna and so far it's a disaster on the KA1103 and RS DX-398. It amplifies all right but seems to amplify the noise too and throws in more noise for good measure. I just got it today and haven't had a whole lot of time to play with it. It may be my location (one mile from three low power AM stations). At least I only paid $21 for it.

Interesting replies, and they do boost my confidence in this radio.

Having now played a bit more now with the radio, I can report further on my findings. I was running it from the supplied power unit while the batteries were in an external charger. Had the radio on for a couple of hours running like this, and then switched off.

Later that evening, I switched the radio back on while still powered from the power-pack - and... nothing! I unplugged the power pack and refitted the batteries, but still nothing. The clock display had also locked.

Figuring my luck couldn't get any worse, I went to fetch a screwdriver to open the radio and look for a blown fuse or protection diode, I was not happy.

And then I noticed a teensy little hole on the front panel marked "Reset". A simple prod with a ball point pen restored life and my radio works fine again! I was not aware that my radio ran on M$ software...

I tried the FM band again, and the previously weak or non-existant stations came to life, using the telescopic antenna. The transmitters are flea-powered at around only 5kW and they are both transmitting from towers at a distance of 120Km over undulating countryside.

The radio is still new to me and I have to play around with it some more, but all in all, I am now happy with my eBay purchase!

Is it acceptable to power the radio from the supplied AC power pack without batteries? I figured my external charger would probably do a better (definitely quicker) job at charging the batteries.

From: Ken
Topic: 1070 Message: 1071

Sure, first hang the loop and extend the spreader. Connect the long cable between the loop and the controller. Install the batteries and make sure the power led shows the controller is powered. Connect the cable (the little rat tail on the controller) to the antenna jack on the radio. Tune in the shortwave station you want to listen to and then very slowly turn the tuning control on the controller. You should notice a definite "bump" in signal strength. Sometimes it is easiest to find the bump (or notch) where the antenna is resonate with the frequency you are listening to by tuning the radio up or down 10 or 15 khz to an empty frequency and then tune for max noise.

1072. headfone jack

Yahoo group: de1103
Date: 2007-05-20 16:03:08 UTC
From: yzordderrex2003
Topic: 1072 Message: 1072

My headfone jack doesn't turn on the speaker when i unplug the phones. The jack looks to be covered with a molded plastic piece. Can the jack be unsoldered and repaired? Has anyone done? Is there a site on web where I can get this part?

In either case - to fix or replace - it will have to be removed - so here I go.

regards,
NEO

My power supply makes reception very noisy, so I run it from batteries
charged from an external charger.

I find mine to be much more sensitive while using alkalines over the rechargeables. You are right the wall wart is too noisy for regular use.

To answer my own question:

Switch portion fell apart in my hand when i took jack out, so I just hardwired speaker on. Ferrite bar was broke in half so I glued that back together too. Radio has taken a few nasty tumbles so I got to expect this. Plays like new now.

Hi Leon,

I haven't tried it again solely on power pack, had a bit of a fright when the radio got a software lock the first time. SW reception using batteries is impressive, however.

1077. Reduced sensitivity?

Yahoo group: de1103
Date: 2007-05-18 12:24:01 UTC
From: burtthecath16
Topic: 1077 Message: 1077

I recently picked up an 1103 from Weems Creek Solutions. Thus far, I've been quite pleased with the radio but have noticed that recently the sensitivity when using the whip antenna SEEMS less than when I first got the unit.

I've been comparing shortwave broadcasts with an old Sony ICF 4910 portable and the Sony (even though it's 20years old and very barebones) seems able to pick up anything the 1103 does (in the shortwave broadcast bands) and sometimes seems a little more sensitive.

With the 1103 whip antenna, I DO pick up ssb and cw signals, so it's not a case of no sensitivity; it just seems less than before.

Anyone else have this issue or are the bands just really crappy lately.

BTW, with the long wire attached, the radio is almost too sensitive.

Any ideas? Insights?

Thanks in advance,
Nick

I've had my several month old DE1103 lock up like this when switching sets of batteries (without the power adapter attached). Never as I've plugged/unplugged the power adapter (with batteries in the unit). Each time, the reset brought it back to life with no loss of the clock or memories. Now I just keep the rechargeable batteries in place. Other than this little glitch, this has been a very fine radio for the price.

Just use a simple balun on the longwire and or use a preselector with gain turned down. The MFJ 1045c is what I use.

Probably just the change in season, I got mine a few months ago and
the reception in the winter months is definately stronger on SW.

1082. LW sensivity

Yahoo group: de1103
Date: 2007-05-21 19:43:07 UTC
From: D.Kremp
Topic: 1082 Message: 1082

Hi all,

I'm new in the group and comes for the 1st time.

I bought a DE1103 2 weeks ago and I must say I'm a bit desappointed about its sensivity on LW. I find it almost deaf. I don't hear any NDB (non directional beacon) at all, only the strong french stations. Even the german signal station DCF77 on 77,5 kHz and the british one MSF on 60 kHz are unaudible. Bear in mind that both of them activate different clock radios here at home in very comfortable conditions !

The GRUNDIG Sat. 700 is far better on this band.

I made the tests with the ferrite antenna AND with the telescopic antenna ("under 100 kHz tuning method"). On MW, SW and FM it's likely very sensitive and works fine.

I never read of any lack of sensivity on LW in the reviews.

Am I the only one ?

All the best

Dominique

I think I may contact Kaito USA and see about sending the unit in.
This morning, using the whip antenna, I could barely pick up Radio
Australia. My 20 year old Sony ICF4910 was picking it up with Q5 copy.
I've tried resetting the radio and all that and still am noticing
marked reduction in sensitivity.
Something is not right...

Remember that propagation conditions are variable, with the day, month, season and year. Also we are in or near the minimum of solar activity. I also note some days there is less "spice" on the shortwaves.

An external wire, not too lomg should improve in every case your reception. But here, be careful with the design problem that the DE1103 has: it's delicate front-end, prone to burn out under static electricity (try to don't touch with your fingers the telescopic antenna when there is a dry and windy weather, or you walk over a rug, and your body gains enough static to burn the FET). Also if you use an external, outdoor antenna, disconnect it when lightnings are on, and always touch the tip of the antenna plug with your finger against the wall, for some seconds to discharge yourself and the antenna.

Well, if the front end FET is a likely problem, is it an "all or nothing" type of situation? In other words, if the FET is fried the radio would not pick up anything? Or would it just be less?

1087. RE: [de1103] Re: Reduced sensitivity?

Yahoo group: de1103
Date: 2007-05-23 02:36:31 UTC
From: Horacio Nigro
Topic: 1077 Message: 1087

Some words to explain my receiver+antenna configuration.

I have always used a previous existing external antenna, near 25 meter long, and this obviously had to be too much signal for the front end. So I had no other solution that to keep an impedance transformer I had, a 9:1 toroidal one, at the near end of the antenna, connected close to the beginning tip of the coaxial cable. But still I had too much signal. Then, down, at my listening post I had to build another balun, this one with a ferrite bar. This joint system gives an usable matching. Otherwise I had too much noise, which was not from an atmosferic noise, but a noise generated by an overloaded front end circuitry.

With this configuration, a strong lightning in the nearby once caused the FET to blow some months ago. WITH the external antenna, I still had reasonable reception, but was not the type I had enjoying before. I could copy local and regional hams, but not those being intercontinental, say on 40 meters ham band. And I had to remove the ferrite balun. After the repair, I regained more vivid signals. had to reconnect the second balun. Now, I am noting that signals are bad from 12 or 13 meterband upwards, but I strongly believe this is due to propagation conditions.

So I believe the famed good sensitivity of the receiver has is due to the RF amplifier built around Q1.

With the telescoping antenna only, the difference was notorious, after and before the fried FET. The receiver on SW was deaf with Q1 blown.

I prefer an external antenna for my DX listening.

From: burtthecath16
Topic: 1077 Message: 1088

Thanks for the replies and insights! This is a great group!

I've been doing some more comparisons between the 1103 and my little Sony ICF 4910.

Last night, I was listening to the 1103 with just the whip antenna and was copying signals on the various broadcast bands and some CW/SSB on the ham bands. Not too bad.

However, this morning, I was doing a side by side comparison with the Sony and was disappointed. The Sony with its little 1 1/2 foot whip antenna was pulling in Radio Australia, BBC-Caribbean, etc. with no problems. The 1103 wasn't listenable unless I had the external antenna plugged in and, even then, it was neck and neck with the Sony.

I KNOW the 1103 was doing far better than this just a short while ago.

So, I will contact Kaito and see what they suggest. The radio is still under warranty so I figure the worst that could happen would be I send it back and they tell me it's fine.

I'll let you know what happens!

Nick

From: Igor Danilevych
Topic: 1082 Message: 1089

Hello D.Kremp!

Monday, May 21, 2007, 10:43:07 PM, you wrote:

>

I bought a DE1103 2 weeks ago and I must say I'm a bit desappointed about its sensivity on LW.

Am I the only one ?

No, I have bad sensitivity on LW also.

Old receiver made in USSR is much better in this band.

73!

This may be off-topic; I'll risk chastisement to pass along an old LW trick which may still have some use.

Back in the 1960s one could still buy (in the US at least) military surplus BC-453 aircraft receivers. These tuned from 190-550 kHz and had an 85-kHz IF stage. By coupling the IF stage of a regular SW receiver to the antenna input of a BC-453 tuned to 455 kHz and using it as the "rest of the receiver", its greater selectivity would improve the performance of the rig. Someone with older equipment might be interested in (carefully!) trying something similar.

Again, sorry if this is too off-topic; if nothing else it establishes my advancing age :-)

In order to make the relatively "Short"external longwire antenna
resonant to the desired LW station(s)will likely help. This can be done
with a suitable LC network (a coil and a variable capacitor connected
in parallel) inserted in series with the external antenna.
Likely an 455Khz IF transformer coil(or whatever coils found in your
junk box) and with a suitable variable capacitor to tune to the desired
LW station(s). Hope this helps.
PS I never try this in the LW band yet found successfuly when
DXing "Weak" MW bcst stations.

There are details about building an antenna tuners --- to make the antenna resonant to the specific frequencies. Even it is designed for SW but if you tripled (not doubled) all parameters (coil size, number of turns, variable capacitors values ..) You can make one that is capable to work for the LW freq.
http://www.radiohc.org/Distributions/Dxers/pi-tuner1.htm

From: jdhardin449
Topic: 1093 Message: 1093

I measured the current draw of the 1103, and it is between 67 and 118 ma depending on the volume level. Listening to shortwave at a volume level of 15, the current is about 100 ma. This corresponds to the roughly 10 hours of use I get from the stock 1100 maH batteries.

Mine purchased recently came with 1300 mah batteries. I never knew that they were ever made with that small capacity. My first Radio Shack Nimh's were 1600 mah. Since I got my 1103 I've stopped using most of my other radios.

Sooo, fellow 1103 users, how has your reception been lately?

Band conditions have been goofy at best. I've gone from thinking my radio was on the fritz to getting good copy using just the whip antenna. Things have been really up and down here in Michigan.

How have things been going in your neck of the woods? What type of antenna (if any) are you using?

Good dx,
Nick

Wednesday morning was especially bad here on the West Coast. The BBC relay from Singapore on 9740 was almost non-existent. It's been many months since the conditions were that bad. The signal is usually fluttery but the about same every morning. I've been so happy with my KA1103 that I've barely used my Sony 7600GR in the six weeks I've had the 1103. I do use the Sony for that BBC relay because the synchronous detection helps even out the fluttery BBC signal.

Dennis:

Have you noticed that sometimes your Sony pulls in a little better than the 1103 and vice-versa?

I have a little Sony ICF 4910--about twenty years old--and I've noticed when doing a side-by-side comparison that sometimes reception is better on the Sony than the Kaito. I've also noticed that sometimes the opposite is true. Now, one would think that it would be one way or the other all the time, but that hasn't been my experience. I've thought about sending the 1103 in to have it checked out, but (right when I'm ready to pack it up, of course) it'll come back and impress me with its reception.

What's your experience been?

From: wgmartin999
Topic: 1064 Message: 1099

As has been alluded to by other responders, this seems to
be a standard happening with the 1103 when you let the
batteries run down far or operate it with no batteries installed
on the external power supply. Exactly the same thing
happened to me when I was using regular non-rechargable
alkalines that ran down and I took some time measuring them and
the new ones I was going to put in while I had the external
power supply providing power to the 1103. It wouldn't
function when I installed the new batteries until I pressed
the "reset" and then it came on with volume "40", same as
it did when I first took it out of the box when new. But
the memories were all still there and it then functioned fine.

So it seems inadvisable to let the batteries run so low that
the set stops running, and always keep batteries in it even if
you use the external power supply.

1100. FM reception & antenna orientation

Yahoo group: de1103
Date: 2007-06-10 00:11:51 UTC
From: wgmartin999
Topic: 1100 Message: 1100

Even though I've messed around with radios for decades, I've never quite understood just how whip antennas' orientation relate to the reception of weaker fringe-area FM stations. Usually, extending them all the way does not help; the whole band gets swamped with images of the strong locals. But sometimes bending them over horizontal does help, even if fully extended. This usually only works with them pointed in one specific direction; I would have thought this should work with the antenna pointed 180 degrees from that direction but it usually doesn't.

Most often, the best reception of a weak semi-local FM comes with the whip extended only one or two segments, at right angles to the case, and with the radio laying flat and rotated to the position where the station sounds clearest.

This seems counter-intuitive; that length whip isn't similar to the lengths of FM-dipole antenna elements (like the ones made from 300-ohm twinlead). And is the reception best when the whip is broadside to the direction of the station's tower from your site, or when it is pointing at, or away from, that azimuth?

I suppose that I've always listened in a too-strong FM-signal environment here in the city; maybe the effects of whip-antenna positioning would be more obvious in a non-RF-saturated rural area where people had to use directional VHF yagis and rotators for reliable FM reception from various directions.

Any VHF antenna experts out there have any comments?

1101. RE: [de1103] Re: My DE1103 has arrived!

Yahoo group: de1103
Date: 2007-06-10 00:27:39 UTC
From: Horacio Nigro
Topic: 1064 Message: 1101

My routine is the following:

I use the AC power with the batteries installed, when I am at home.
When I leave home for work, I unplug the rx from the AC outlet and from the receiver.
The receiver is switched off, touch-blocked with the proper button, the batteries provide the energy.
Also antenna is disconnected. The rechargeable batteries are charged from time to time, once a month with an external charger.

When I arrive home, I connect all cables and power, and touch the tip of the antenna plug against the wall with my finger, as I said before and as was suggested here at the forum.

BTW, I have found excellent companions in a pair of Sennheiser OMX 52 earphones (but had to replace by myself the original cord which became defective) and a 2+1 computer audio amplifier from Genius (setting volume of the DE1103 is normally on number 23).

1102. RE: [de1103] FM reception & antenna orientation

Yahoo group: de1103
Date: 2007-06-10 00:38:15 UTC
From: Horacio Nigro
Topic: 1100 Message: 1102

My advise: Don't play too much with the DE1103 whip antenna. It's been reported to get broken. That was said to me and I fullfill that.

In my urban area, I used to extend one to two elements of it, not rotating it, and could listen to FM stations as far as 150 km. I am in a near 100 meter above sea level site.

The footnote: I am not listening anymore to FM in my Degen, since when I had the filter mod (110+53) made, these filters converted the bandwidth into an excesive narrowed level, which made stations to be distorted. The pity is that original filters were destroyed in the removal. Which are the factory standard values for the FM selectivity filters?

Another DE1103 will come for me from Italy in August, when a friend comes to visit me.

From: Dennis Gibson
Topic: 1103 Message: 1104

WRTH has never even acknowledged that there are high quality radios being manufactured in China. Every year I go to the bookstore and after spending a few minutes looking at the new edition I once again decide that buying WRTH is a complete waste of money. It's hard to believe how far out of date some of their information is. Some of the omissions and/or items needing corrections are for things you'd had to have buried your head buried in sand and never heard of radio to have missed. I stopped sending them corrections and additions/updates because they don't use them.

Contrary to that opinion, several well regarded DX SWL organizations and listeners, still consider WRTH the best source of info to have printed near your receiver. The Danish SW Clubs International via its chairman Mr. Anker Petersen has made comparisons with Passport to World band radio, and Klingenfuss Super List and WRTH has the credit of better service to the user.

Of course the complementation with Internet sources, which update every week, as Glenn Hauser's DX Listening Digest or the different Yahoogroups devoted to SWL DX is very important. Also WRTH has released periodic updates via its website.

1108. Re: FM reception & antenna orientation

Yahoo group: de1103
Date: 2007-06-14 03:19:48 UTC
From: Tom Holden VE3MEO
Topic: 1100 Message: 1108

Will, your powers of observation support the theory. FM broadcast antennas in the US and Canada are almost always designed to radiate with circular polarisation, i.e, with a vertical (Y) and a horizontal (X) component phased 90 degrees. This is considered superior to radiating only one component, even though there is a 3dB loss in radiated energy in that component when 50% of the power is given to the other. The reasons are that:

1. Receiving antennas of all polarisations are supported instead of favouring just one; a truly vertically polarised antenna would pick up nothing from a purely horizontally polarised field. Receiving antennas range from vertical whips to horizontal dipoles through power line and earbud leads of arbitrary polarisation.

2. Multipath distortion is supposed to be mitigated compared to linear polarisation, whether horizontal, vertical or slanted (X and Y fed in phase).

Polarisation changes through refraction and reflection - the X and Y components are variously attenuated or rotated and this can change at the receiving antenna when it is moved, sometimes even relatively short distances, e.g., 1/2 wavelength or ~60".

A vertical monopole or dipole has more or less equal 'gain' in all directions in the horizontal plane for vertically polarised signals. It is a maximum when the monopole or 1/2 of the dipole is ~1/4 wavelength, i.e., ~30" at 100MHz. There are greater maxima at longer lengths, e.g. 5/8 wavelength, but set that aside as it's out of range for the 1103 whip. Its sensitivity falls off as it is made shorter.

The 1103 whip is 36" fully extended, i.e., ~1/4 wavelength at 78 MHz, and ~0.35 wavelength at 108 MHz. For the 88-108 MHz range, extending it to 26-30", i.e., all but two sections, is probably optimal, ignoring receiver overload.

A horizontal monopole or dipole of similar dimensions has a figure 8 pattern of sensitivity (or directionality) in the horizontal plane for horizontally polarised fields, with the maxima broadside to the antenna. The 8 pattern gets smaller and squatter as the length is shortened.

A tilted monopole has a much more complex sensitivity to both polarisations, ranging between the circular pattern of the vertical antenna to the figure 8 of the horizontal, proportional to the tilt.

Real listening environments with many obstructing and reflecting surfaces modify the free-space patterns described above, e.g.,

electrical wiring, metallic plumbing, re-bar, window frames & screens, siding, troughing, the earth and your body. The receiver's own pc board, power cord and earphone leads are also contributing factors making predictions more like guesses.

Weak signal reception in a strong signal environment is always challenging, moreso if the receiver is especially susceptible to overload (all are at some level). Antenna orientation to discriminate against the strong while favoring the weak is desirable but very difficult to achieve unless all the interferors are at right angles to the direction of the desired station - in which case the horizontal monopole would have the advantage over the vertical. Shortening the whip weakens all signals, perhaps below the threshold of overload, while hopefully not weakening the desired signal below the threshold of detection - could work with either vertical or horizontal.

73, Tom VE3MEO

Thanks, Tom! It's cool to read a clear explanation of a complex matter.

Our community (Asheville, NC US) got a memorable lesson in the intricacies of FM reception several years ago. A licensing dispute reached its climax when, for most of a day, two local stations were broadcasting simultaneously on the same frequency. In a moving vehicle, which station one heard would shift back and forth, sometimes within a very short distance. Must've tied the local ether up in knots...

It's the "FM capture effect" - the strongest signal gets received and there
is very little if any interference between them.

From: Eric
Topic: 1106 Message: 1111

I've just bought two from the chap who sold me my DE1103. Cost is $7.90 each with free postage world-wide, $1 insurance. I found this seller to be most reliable and my radio arrived in South Africa undamaged. The packing was perhaps not of the best, but it was very colourful :)

I'm new to the group and also new to Short Wave Radios. I looked at the files and also previous posts (not all I admit).

I just bought the KA11003 to listen to republic broadcasting network on the Short Wave. I have a schedule that says to tune into 12.180 , 12.160, or 5.050 depending on the time of day.

So, how do I tune into these stations? For example do I enter "12160" then press "band+"? When I do this I get 12160 KHz. The clarity is very bad and it doesn't sound like the station I am trying to hear. The other thing is the AM indicator stays on. Is it supposed to stay on? And for the life of me what does SSB mean?

Please help I feel like sending this machine back!

If the LED is on for SW stations, you must have pressed the SSB button. You need to turn it off, by pressing the SSB button again. You should then be able to hear the station clearly. The LED also comes on when you listening to an FM station, if it is transmitting stereo.

SSB stands for single side-band. Most SW transmissions are AM (amplitude modulation). SSB transmissions consist of only one of the side-bands, and the carrier is suppressed. To hear them properly the carrier needs to be generated in the radio, which happens when the SSB button is pressed.

You are doing it correct, but the nature of shortwave makes it problematic sometimes to receive. That´s way the station provides you with different frequencies to try.

> The other thing is the AM indicator stays on. Is it supposed to stay

Broadcasting stations use AM in almost all cases. SSB is single side band which is mostly used by utility and amateur radio. You can read more about it at http://en.wikipedia.org/wiki/Single-sideband_modulation .

Hi,

I think that is it not reall, because I can test for instance SAQ from
Sverige, and signal was unreadable with Degen.

But I can heard it with my modificated mini-whip antenna by PA0RTD and
audiocard and Spectrum -lab software!

I think that you need place without disturbance, far and far from
city, and receivers for it (VLF group at yahoo).

But you can receive stations cca up 25kHz, if you use long wire
antenna and tunable preamplifier.

I think that you need other receiver for it, and maybe also other QTH.

Regards, Jara "rat"

Cheapest is from one of the Ebay suppliers, but you might be unlucky and get
a dud and have to return it. Most are OK though. Kaito probably tests them
before sending them out.

From: Dennis Gibson
Topic: 1118 Message: 1126

Oops!! I didn't notice that all three radios in that auction have apparently already been sold. However for $92.90 (you have to use "Buy it Now") they have one on eBay that includes a portable wire antenna:

http://cgi.ebay.com/KAITO-KA1103-GRAY-AM-FM-SHORT-WAVE-SSB-RADIO-RECEIVER_W0QQitemZ250139135104QQihZ015QQcategoryZ4673QQcmdZViewItem

Radios4You is an American company. They supply the proper 110 volt AC adapter/charger and an English manual. There is a 1 year USA warranty. Mine only took a few days to arrive. It's so good that I've hardly used my Sony ICF-SW7600GR since it arrived.

Getting the portable wire antenna doesn't mean you absolutely have to use it to hear a lot of stations. It's quite hot using only the whip antenna. Kaito includes a 35 foot wire antenna. The price of the KA1103 has gone up in recent months because it has become known as an excellent and fun (I like the fake LCD analog dial) radio.

Looks like a very nice receiver, perhaps in the
same category as the DE1103. There is a review in
Japanese (where it is compared with the Sony
ICF-SW7600GR) that can be accessed via the Google translator at:
http://www.google.com/translate?langpair=ja|en&u=http://fade-in.air-nifty.com/radio_and_pc
/2007/06/sw7600gr_vs_kks.html

The "translation" is funny but anyhow something
can be grasped. It looks like the selectivity is
not that good, but it is very sensitive.

It seems however that we will have to wait for
somebody in this list to purchase a KK-S500 in
order to have a deeper insight of this receiver

I'm glad I'm not the only one who didn't understand much of the translated comparison. Translation is one of the few things Google doesn't do well. There are rumors that a couple of Chinese radios with synchronous detection will be coming out soon. There were supposed to be several in the last few years that I never heard anything more about. I have a Sony ICF-SW7600GR so a Chinese radio with synchronous detection would have to perform very well at an inexpensive price before I'd buy one. I wish my KA1103 and Radio Shack DX-398 (same as the Sangean ATS-909) had synchronous detection.

I bought a KA1103 in April and I like it so much that I haven't used my Sony 7600GR very much since then. I may be in the minority but I think the LCD fake analog display is fun. I also have a KA1101 and I think it's excellent. I'm curious about the KA1102/DE1102. Does anyone here have one? If so do you like it?

Well, that is a good question. There is very
little info in the "western" world about this
receiver and nowhere is stated whether or not it
has SSB capabilities. But, if it has synchronous
detection, then the basic hardware for SSB should
be present, right? Or am I wrong?

The web page where it is sold in ebay does not convey much info, either.

I assumed a radio with synchronous detection would have SSB but this one doesn't seem to. Maybe that's a good thing. If it has SSB I'd be tempted to buy one even though I really don't need another radio. Two radios with synchronous detection will have to do for now. Here's an eBay auction with photos and description:

http://cgi.ebay.com/NEW-KCHIBO-KK-S500-DUAL-CONVERSION-SW-FM-MW-RADIO_W0QQitemZ260137512147QQihZ016QQcategoryZ15051QQcmdZViewItem

1137. DE1103 MKIV mod

Yahoo group: de1103
Date: 2007-07-12 22:43:12 UTC
From: John Wells
Topic: 1137 Message: 1137

I just received my DE1103 from TQChina. Excellent Seller!

I made certain everything worked and decided to put protection for Q1 in the radio. I cracked it open and had a look. The board was stamped MKIV. The KD1TE mod was called for since I had 2K resistors for R223 and R224. Closer inspection disclosed that these resistors were in series with R226 and R228, each with a value of 3K (marked 302). This gave a total of 5K for each leg of the circuit. The original schematic called for 1K (marked 102) for R223 and R224. These were in series with 3.9K resistors for a total of 4.9K. I decided that a mere 100 ohms difference was not worth the effort of incorporating the mod.

I did, however, install two diodes IN4148 (opposing polarity) from ground to L2, hoping to provide static protection for the FET Q1.

The rig sounds ok to me and I'm happy with it.

Well, then it is not in the same category as our
beloved DE1103. BTW I have sent a question to
ebay seller liypn about SSB, but so far no reply.
This seller never replies my questions :-(

Finally, Liypn has just answered my question
(first time!): no SSB :-(He/she did not answer
my second question (does it have more than one
bandwidth?) The pictures don't show any slide
switch for changing bandwidth, but who knows, perhaps via keyboard...

John --

Thanks for providing the details about R223, R224, R226 and R228 on the MKIV version.

Bottom line is, if it sounds good to you, don't mess with it! The following discussion may not interest you, but may interest others on the list.

I'm a bit surprised by the resistor values in the newer version. These resistors make up a voltage divider circuit which reduces the level of the audio signal going into the audio amplifier chip.

Since there are two identical channels (for FM stereo), we can limit our discussion to just two resistors, R223 and R226, which set the level for one channel. Simplifying slightly, their effect is to reduce the signal voltage level going into the audio chip by a factor of (R223)/(R223 + R226).

The values on the schematic found on the web, are R223 = 1.0K, R226 = 3.9K, resulting in a voltage reduction factor of (1)/(1+3.9) = .204 So, if a signal going into this resistor network had a level of, say 2 volts, it would come out of the network at (2 * .204) = about .41 volts. This is the situation that my (KD1TE) mod attempts to restore.

The "wrong" components I found in my 1103 were 2.2K and 3.9K, respectively, resulting in a voltage reduction factor of .361, resulting in a higher level getting into the audio chip, which is why the audio was distorting.

The interesting thing is that on your MKIV unit, the values are 2.0K and 3.0K, respectively, which result in a reduction factor of .400. This actually should produce even higher distortion than I originally encountered.

It may be that on the MKIV unit, other component values were tweaked, which adjust the levels in other ways. I have no way of knowing. Don't fix it if it ain't broke!

Enjoy your 1103! Its the most remarkable radio for its size and price that I've ever encountered.

1143. DE31 loop

Yahoo group: de1103
Date: 2007-07-14 00:47:22 UTC
From: Dennis Gibson
Topic: 1143 Message: 1143

I can't decide whether or not my DE31 loop is defective. There's only one place I can put it permanently. I have only seen an improvement a couple of times using a number of different radios. I think I'll move it temporarily for testing purposes. Are there any DE31 owners here who can tell me of their experiences with it?

Yeah, I find it to be particularly effective for my 1103 and E5. It also works pretty well with my 1102 and DX398. It didn't seem to do much for a Sat800. It will definitely increase the noise level, but often allows faint signals to pop above the noise. Very directional. Watch out - the controller switch breaks easily. It doesn't seem to work quite as well as my AN-LP1, but it is a lot cheaper.

I'll be in Hong Kong this weekend and want to see if I can find an 1104. Last time I was there I couldn't find any radios in Wan Chai or Kowloon. This time I am going to try Sham Shi Po. It is more hobbyist and computer parts orriented and less cell phones and digital cameras.

I did get a 9700DX here once at a good price.

I'll let the group know if I am successful.

Well, no better luck in Sham Shui Po. There was a neat electronic flea market street (Apliu Street) and the Golden Shopping Center had lots of computer related bargains but the only Shortwave radios were a couple of street vendors with Kchibo and other low end radios. Radios seem to be a specialist item out of the mainstream of consumer goods such as cell phones, MP3 players and digital cameras.

I did find one mainstream dealer with a few older Sony sets and picked up an Sony SW 22 at a good price.

1154. Questions from New List Member--Recording

Yahoo group: de1103
Date: 2007-07-25 02:30:36 UTC
From: Daniel A. Piazza
Topic: 1154 Message: 1154

Hello All,

I am a new list member considering the DE/KA1103 as a backup/travel radio for my DX-394. I must say I have been impressed by the uniformly positive reviews for this well-under-$100 receiver.

I'm also looking at the 1121, mainly because I like the idea of making digital recordings directly from the radio. However, reviews and posts on the DE1121 board do indicate that the 1121 has some significant firmware and usability problems. And there is general agreement that the 1103 is a better receiver.

Does anyone on the list have experience making digital recordings from the 1103, maybe by using a mini plug patch cable from the line out of the radio to the mic in on the computer? I searched through the message archive, but the few that mentioned making recordings seemed to have done it with a tape recorder.

Or maybe I wait for the rumored impending upgrade of the 1121, with a 512mb chip, and hope it also fixes some of the other bugs that have been pointed out.

Dan - I haven't made any recordings from my KA1103 but I just want to add one more positive review. I am extremely happy with mine, which I've had for three months. Passport to World Band Radio called the ergonomics "hostile", which is blown way out of proportion. There are a couple of quirks but I haven't needed to refer to the instruction manual after reading it once. I think the fake LCD analog display is fun. The sensitivity and selectivity on both SW and MW is excellent. I had a Sony ICF-SW7600GR (with the wonderful synchronous detection) when I bought my KA1103 and I've hardly used it since my 1103 arrived.

The plan was for the 1103 to replace my DX-398 as my travel radio. It will but it has also become my every day radio. Now I use the Sony in the bedroom to pick up a weak BBC signal every morning while getting ready to go to work. The signal fades up and down quite a bit and the synchronous detection evens that out. The 1103's audio is better than the Sony's.

Spend the extra $$ to get the Kaito with a US warranty and the correct US voltage AC adapter/charger. Sending a Degen back to China for warranty repair would cost more than the $$ you saved by getting a Degen.

Topic: 1157 Message: 1158

Since de1103 can change frequency in 1kHz, you need not think 9kHz or 10kHz.

From: Sergio Potes
Topic: 1159 Message: 1159

I have a D1103 and it was working fine. Recently in SW the sensitivity is way down. MW and FM are fine. Has anyone had this problem?
Thanks for any feed back! Sergio AE4TO

Dennis

From a copy of a KA1101 manual I have:

"9K/10K Step Selection
The default setting for the unit is 10KHz step. To convert to 9KHz step, press RESET button first, the LCD shows SET, then press ENTER button, the LCD shows 9-10, press number 9, conversion succeed.

Press RESET button again to resume 10KHz step."

NOTE! According to the description for the RESET button, activation will erase all memories and the clock setting. I do not have an 1101 to verify the instructions. Good luck.

Glen

I just tried changing the LO/DX switch on my KA1103 from DX to LO. It does have an effect on MW. It wouldn't hurt to look. As I'm writing this (6:50 AM local time in California) Radio Australia in booming in on 9580 khz. on my KA1103 using a Radio Shack windup antenna indoors. I have a Sony 7600GR in another room and the signal strength is the same as the 1103 using an identical antenna. The BBC World Service is coming in on 9740 khz. from Singapore. The signal is much weaker but the same on both radios and is the same it has been for a long time.

Yes this was on dx already. The problem is some where else. I think it may be the pramp...static may have damaged it.

A damage of the front-end Field Effect Transistor is the worst cause of sudden lack of sensitivity in the DE1103. This happens after physical contact with the antenna with a finger plenty charged of electrostatic -likely to occur in dry weather and after walking over a rug. Other reason for FET being burnt is a static current built over the external aerial under circumstances of dry and windy weather.Or after a lightning storm ocurring near the house.

If this hasn't the cause I should remember that shortwave fadeouts are common these days,with very poor propagation conditions specially from 10MHz up.

If the FET was fried, several members at this yahoogroup -myself included- have reported to have it replaced with another one. In some cases via a do it yourself technique which implies certain care with both dissasembling the back cover of the receiver and desoldering the component and soldering the replacement.

I am going to try fixing it. This is a very sensitive radio and is very small and I can listen to ssb and cw. I am into ham radio but like swl too and I like all these small radios. You can build a very simple tansmitter and use this radio for receiving.Many thanks! Sergio ae4to

No, it'd be the "line in" jack. The "mic in" is for very low-level signals produced by microphones, and the signal from the radio would be *way* too strong. This would at least cause a lot of distortion, and might also damage the sound card/circuitry in the computer.

Thanks, Dave.

I went back to my computer's manual, and it says "The microphone/line-in jack accepts audio line-in devices (e.g., audio CD player, stereo walkman)." Is it possible that the two are combined? (It's a laptop.) I don't see any other input jacks.

Never connected the patch cable to my PC, but in that case the connection should be over the line-in jack of the computer. I've already read that you have a laptop with combined mic/line-in input. This connection you want to do should be useful not for only recording, but by using the proper software and via your soundcard to proceed to decode utility radio signals, as radioteletype, ham slow scan TV, etc. Alas, I haven't tested this, yet.

MP3 player with line-in is propably easiest way to record.
With PC I recommend to use galvanic ground loop isolator between computer and receiver. It reduces interference from pc and protects your equipments from being damaged by potential differences between pc/receiver. Quite good free PC-programs for recording and handling MP3-files are for example: SVRECORDER and MP3DirectCut

Remove the tuning knob and take a look at the shaft. Newer versions have an encoder with black plastic shaft, older (and supposedly problematic) versions have an encoder with metal shaft.

Open the case and read the markings on the main board. Mine (purchased less than a year ago) is "Mark IV" which to the best of my knowledge is the latest revision. However minor variations (such as software versions) may not be reflected in this markings.

Enjoy your 1103!

73,

From: knyuen88
Topic: 1176 Message: 1176

The 1060 Khz KYW news radio in Philadelphia Pa, can also be picked up on 160Khz -- loud and clear, no distortion.
Is the KYW station also broadcasting on 160Khz ?(very unusual if any US broadcasting station will operate on such Longwave band) or sorts of DE1103 design shortage(s)--- image of the 1060 Khz, cross modulations ... etc ?
Any idea?

If it is a single conversion superhet this is true. However when consider the DE1103 is a double conversion type (only the first 48Mhz Local oscillator is tunable while the 2nd Local oscillator is not ---- using a fixed freq xtal osc.to down convert the 1st IF freq to the secind 450Khz IF freq --- then such " -900 Image" pickup should not occure, true? Nevertheless you are right that the 450Khz IF freq should have something to do with this problem.

1179. KA1103 as travel radio

Yahoo group: de1103
Date: 2007-08-11 23:13:41 UTC
From: Dennis Gibson
Topic: 1179 Message: 1179

I'm on my first trip with the KA1103 as my travel radio. I already knew how great it is at home but it has completely exceeded my expectations as a travel radio. There's no need for an external antenna for SW during the day in the hotel room and with the laptop turned on not very far away. Both MW and FM are excellent. What a bargain for $80!!

I used to use my DX-398 as a travel radio. The KA1103 completely blows it out of the water.

1180. Re: [de1103] KA1103 as travel radio

I've haven't plugged in headphones to check out the sound. I have several Sennheisers that I'll use to check it out.

I also have a Sony 2010. It does not go on trips. I shudder to think what it would cost to repair or replace.

Why do you prefer another radio for SSB? I don't use my 2010 much but my recollection is that it doesn't have continuous tuning for SSB. Of course it does allow you to select which sideband you want, which the 1103 doesn't but I find that a small annoyance.

It is excellent on SSB but doesn't have an LSB/USB switch. That doesn't bother me at all. It is an outstanding performer in a small package and the $80 USD price is extremely reasonable. I bought a Sony ICF-SW7600GR several months before the KA1103 and now I only use it when I want synchronous detection.

SurplusComputers:
http://www.surpluscomputers.com/store/main.aspx?p=SearchBody&search=kaito
Shipping will be about $10 for the first item. Each additional item
only adds about $1 more to shipping, in my experience.

Also the WRX-911 for U.S. $10, which got decent reviews on Amazon:
http://www.amazon.com/Kaito-WRX911-Worldband-radio/dp/B00066D1GI/ref=pd_bbs_sr_1/104-0043985-5943929?ie=UTF8&s=electronics&qid=1186967105&sr=8-1

I agree. The Degen DE1103/kaito KA1103/Eton E5/Grundig G5 are best in this size class. Awesoem performance for the size and price.

That's a great deal. It's as sensitive as the 1103. It's not good for MW DX'ing unless you don't have a halfway strong signal within 100 miles of you. The wide filter is too wide.

As a travel radio, aside from the usual merits mentioned about it, there are some that just don't get mentioned, like:-

1) The very flexible sleep timer. You can program it for how long you think you will take to fall asleep. And the programming is dead easy.

2) Perfect level of night illumination that does not blind you when you switch it on in a dark room. And almost every control that's needed is lit.

3) Whip antenna that's long yet sturdy when fully extended. Great for rough handling.

4) Battery cover that never falls out and get lost in the hotel rooms.

5) Decent looking enough and not too geeky to bring out to the pool side. Try blending with a SW77/2001D but, then again, they are too precious to bring near water.

1189. Chuffing noise while tuning still present on MKIV revision?

Yahoo group: de1103
Date: 2007-08-21 20:44:19 UTC
From: huelbeag
Topic: 1189 Message: 1189

Hello group,

I have 2 DE1103 from Lyipn, perhaps the first revision. Very happy with them, although one deserves and encoder cleaning or replacement :)

One small thing that annoys me is the chuffing noise while tuning the 1103, that is, your hear a 'pop-pop-pop' noise while you tune the receiver with its tuning wheel.

A friend of Russia presented a couple of years ago a solution using (if I am not mistaken) a copper sheet as shield and a few capacitors (you can check in the files session of this group).

Does any one noted if the chuffing noise issue is fixed or improved in the last MKIV revision?

Best regards,

Huelbe
Porto Alegre, Brazil

I get it slightly on one band, but it isn't all that noticeable. It's OK over most of the range.

1191. Sanyo Eneloop Battery Package now at Costco B&M, $26.49

Yahoo group: de1103
Date: 2007-08-24 15:52:52 UTC
From: texnote
Topic: 1191 Message: 1191

This is by far the best deal on AA rechargeables that I've seen in a while:

Costco Item # 183245. Price: $26.49.

Includes one Eneloop charger, 8 AA 2000mAH cells, 4 AAA 800mAH cells, 2 C size adapters, and 2 D size adapters, all in a hard plastic storage case.

The eneloops maintain up to 85% of their charge even after one year of no use, unlike regular NiMH batteries. They are ready to use from the box, no charging needed.

See link to discussion and photos here:
http://www.candlepowerforums.com/vb/showthread.php?t=163112

1192. Thinking of ordering another KA1103

Yahoo group: de1103
Date: 2007-08-24 18:03:58 UTC
From: kf0oujf
Topic: 1192 Message: 1192

I'm thinking of ordering another KA1103. Why would I do that? Well, I take it on the bus with me to/from work. A couple of days ago, it fell of the window on a hard turn and the tuning knob went flying... somewhere. I never did find it. Other than that it survived the fall well.

The only thing I don't like about it is the LW reception (too many images -- if I really want to listen to LW I get out the TS-850s :-D).

Has anyone a "fix" for a missing tuning/volume/memory/etc. knob? And I'm relieved to know it has a black plastic shaft.

Compared to the old ATS-803A, the chuffing isn't noticeable.

3) On mine the tip section is close to pulling out of the rest of the antenna. I've taken pliers to it to crush the last tube down so it doesn't pull out (if I had a crimping tool I'd use that).

I regularly take it on the bus to/from work. It's fallen a few times off the window sill and keep on working great.

Took it on vacation once. It performed fabulously. Could even pick up home MW stations (AM sensitivity is real good). Even at home I regularly hear stations 500+ miles away on MW (my ts-850s throws a filter in the way on MW and it just doesn't do as well there - and is certainly far too big to take on a trip).

Thanks for posting this! I've gotten AA-size Eneloops at Circuit City, which is the only local outlet carrying them in the Asheville, NC area. Still using the factory batteries in my KA-1103 but the Eneloops are great in my big, older digital camera (Olympus D-620L) as well as a portable CD player and, um, toothbrush. Good to see prices coming down.

Wish they'd make true C- and D- sized cells; they'd be pretty stout. Although for the "bigger is better" fans, there are always these... http://www.popsci.com/popsci/automotivetech/f7a1a347b3700110vgnvcm1000004eecbccdrcrd/3.html

Will the radio still work OK without the top piece?

What shall I expect to not have to do in order to receive not less than a great performance from the raydio?

1197. Re: The top section of my antenna broke off on my two year old Degen 1103... :-(

No a big deal. Dont think the length of the antenna is critical. You can verify the performance changes by extending the remaining sections of the broken antenna at various lenghts and judge yourself. Of course you can also use the external antenna wire that comes with the DE1103 instead.

Thanks,

It seems to work just as well even with the top section missing. When i use it in my bedroom, I usually have it hooked up to the Degen antenna which works very well. I guess it was more sorrow at ruining the appearance of the radio than anything else.

Thanks for reassuring me.

I'm having some problems with the volume control also. When i push the button and turn the dial often the volume no longer changes. I have to dial in the level and change it that way.

Other than that, it still performs incredibly well.

Maybe a very small cotter pin could be inserted into the end of the second section and crimped into place? Think "customized" instead of "ruined" :-)

Hi Kari,

This is a fine receiver except on LF.

It's the only drawback I found.

I mentioned it in my post to the list (21 may 2007 / number 1082) some weeks ago. Since that time I made some tests at various places and with various antennas. I got slightly better results on LF with an external antenna ("under 100 kHz tuning method") using a longwire with an antenna tuner (YAESU FRT 7700). Outside the house the LF reception is quite good with the whip antenna. But it's far not so good as the GRUNDIG Satellit 700 with its ferrite antenna.

BTW I noticed that the receiver has to be hold in the hand when used with an external antenna on LF/MF to get rid of a strong internal noise, like if it would need an earth connection, which I never tried.

I'm looking like you for any possible mod which could improve the LF sensivity.

All the best from Normandy/France to Finland

Dominique

Hi Dominique et al

How about winding few turns of coil around ferrite antenna and connecting
external antenna into it?
Is there enough space inside?

From: a1aopr
Topic: 1205 Message: 1205

I was listening to my Degen 1103 before turning in last night using the reel in wire antenna and it was working fine. This morning I turned it on and to my chagrin, there was just noise where the sw and mw bands should have been. The fm works. I've tried leaving the batteries out for a while, but that didn't work. I haven't tried a reset yet cuz I don't want to lose my memories. I also have the Kaito 1103 (which has a stateside warrantee), but unfortunately that radio is not with me here on vacation. Fortunately I also brought my 1102 and Mini 100PE as back-ups. Is the front end toast? 73, Jerry.

I'm sorry to hear about your DE1103. I'd be really unhappy if that happened to me. I own some of the most highly regarded SW portables (Sony 7600GR, 2010 and Radio Shack DX-398) but I use my KA1103 almost all the time. I don't think anything would work if the front end got fried. I know this doesn't help for right now but at least you have another one at home.

Were you running it off AC or batteries? I assume you were using it indoors? I'd try new batteries (alkalines unless you can charge your internal batteries outside of the radio) first and if that's not it I'd try the reset. You can always re-enter your memories.

If it turns out that you're gong to have to replace it I'd pay the extra money for a Kaito. I did and I think it's worth it.

Hopefully not, yet the symptoms show it is highly likely because a long wire antenna can pickup "Much" more statics to destroy the front end than a short antenna.
Good luck !

The current is limited so you won't overcharge the batteries and the
charging time will depend on the state of charge of the batteries. I find it
better to use a separate charger, the power unit supplied with the radio is
too noisy.

Check for earlier posts. I use a smart Powerex MH c401FS charger.
It's got a slow charge (5hr) option that charges the stock Degen
batteries just fine without frying them. I use Powerex batteries in
my DE1107 and DE1103 and I'm very happen with them.

Ditto, but in short... try a separate charger with LED charge indicator, it will be better...

Nash <nash2042004@...> escribi?:
Check for earlier posts. I use a smart Powerex MH c401FS charger.
It's got a slow charge (5hr) option that charges the stock Degen
batteries just fine without frying them. I use Powerex batteries in
my DE1107 and DE1103 and I'm very happen with them.

The portable windup antenna he's using is only 23 feet long. I wouldn't call that a long wire antenna. It's likely he's using it indoors because he's on vacation. If it was running off AC maybe some problem wit that caused this.

Sure 23 feet is not very long when compared to the AM broadcast
wavelengths but it is still long enought to pickup
statics/thunderstorms/lightening ... either inside or outside the house
and kills the frontends by bad lucks. As long as the FM works OK.---
The FM frontend is a seperate section from other AM bands; therefore
likely only the AM frontend was "Fired".
Cannot be a power supply problem; otherwise a dead power supply (either
from the batteries or the AC line) will make both the AM and FM
unoperative (not just the AM bands) More importantly the DE1103
displays will remain blank all the times -- if the power supply
failed. What do u think?

Thanks for all the replys to my plight, I guess if you own the 1103 this eventually happens if you neglect to do the mods that are available in this fine group. As soon as I get home I'll order the parts (wow! 100 fets for 9 dollars). With my eyesight I'll probably need at least 50 to succeed in getting one tacked to the board (I started out building Knight kits so big is preferred for me) LOL. I'll also do the protection diode mod. I've been taught a lesson with this radio. By the way, I was using it with the supplied Degen batteries, no power supply. Also, the radio would not reset when I finally tried that, either with the batteries installed or not. I even let it sit over night without batteries and tried a reset, and all my memories are still intact. Unusual? 73, Jerry.

Well I just wanted to say I was sucessful in fixing my Degen 1103 using the information found in the files section in this fine group. Thanks karkfumm for posting those and VE6TVT for coming up with the jfet replacement part. There seems to be no difference between the Degen and my almost new Kaito 1103. All's right with the world(band), at least here. Several things helped me get through my foray back into SMD work, first, get new desoldering braid (don't use what you bought 20 years ago), a fine point for my 35 watt iron, fine guage solder, plenty of light, and a magnifying headset (a low cost one from Harbor Freight tools), and the least amount of pressure on the iron to get the job done. The trickiest part was getting the board out of the back case for the flip over, then getting it back in without breaking anything, fine wires, plastic case parts, etc. This took more patience than the jfet replacement...for me. I've got a lot of radios, but why is it the one that gets brought back from the dead become your favorite? LOL. 73, Jerry.

That should sell a few radios. I sure like mine. Everyone I've shown it to is impressed; I mostly hang out with MW DX'ers. I'm in the US so I spent a few extra $$ for the KA1103. The idea of having to ship it to China for repair didn't set well plus I got the correct adaptor.

Hi all!
My new DE1103 just arrived a couple of days ago from China. Ultrafast shipping, but the usual delay in Italy's customs :-(
Well, to the problem:
I'm perfectly satisfied with this piece of equipment, but I noticed that the signal strength indicator... well, there isn't any signal strength indicator.
I read somewhere that this is perfectly normal in FM band, but I get no indicator in AM too.
Pls note that the indicator itself works well: it does indicate the battery charge, so there isn't any problem with the LCD's. But... when it comes to radio listening, the indicator disappears. Do you know if it's normal? Is there any fix?
Thanks a lot for answering :-)
Ciao

Hi Bill
It depends where you live but the same receiver named DE1103 can be
easily bought from ebay.
At least I bought mine from ebay/Mr Liypn with Visa-card, straight
from Hongkong. Maybe its a good idea to buy the active antenna that
they are advertising, at least it is not too expensive.
49$ + shipping.
Delivery time (if no customs-delay) to europe about 10 days.
I have bought from him 2-radios, everything went fine.

Does not sound right. The S meter/signal strength indicator should work on all AM bands (not just limited to the MW broadcast band). Hopefully it is simply a software problem. Try to reset the DE1103 (Please read the the manual as well as other discussions in this forum) Hope it helps.

Thank you for your suggestion, unfortunately it didn't work. I tried a
normal reset and a complete reset, but neither succeeded.
It's not too bad, though, the radio works great anyway and the S can
be measured... by ear :)
Thanks a lot.

From: k9kz
Topic: 1231 Message: 1231

I am going to buy a Kaito KA-1103 soon. I am wondering if there have been problems with tuning with the knob. I know that many radios have had encoder problems, even expensive radios, but I am not familiar enough with the 1103 to know. It would be nice to think I will be able to use the knob without problems. I look forward to getting my KA-1103 soon. Also, how can I be sure to get the latest version KA-1103? I plan to buy from radios4you. Also, do you recommend the KAITO KA33 antenna to use with the 1103 or ??? Thanks!

Bill

If the AM stations signals are weak they may fail to turn on the S meter (however very unlikely every AM station signals was weak in all AM bands.) You can compare the DE1103 performance with any "cheap"radio at the same location.
Am afraid the worst can be happened now (loosen PC board groundings, cold soldering joints, bad components .....)
Since all AM bands share the same FET frontend which is subjected to be ""Fired"' --burn out-- by statics, lightening, near by transmitters ..... Even with a dead frontend, as long as if the stations signals were strong enough they still can pass through the "dead" AM frontend FET, but highly attenuated. ..... Please see discussions in this forum. Hope this is not your case, good luck !

Many of the early radios did have encoders that often failed (they had metal
shafts). The current encoders with plastic shafts don't give any problems.
The shaft material didn't have anything to do with, of course.

Leon

Well, I tried everything, now. It seems there's something bad with the
s-meter circuit; but everything else works fine. I'm hearing Dunge
Mezopotamya right now, I think if the frontend was burned I couldn't
hear such a distant station - and at 17.30 PM local time the radio
begins to give me some real satisfaction, shooting out literally
hundreds of stations in every possible language.
It also works fine and copies a (very faint) transmission on the 5 kHz
- yes I did the mod - SINFO 14341; almost unaudible, but *very* clear.
So, I'll live without s-meter - I can stand it :)

> Nevertheless what Mod u have done?

Er... I didn't take the radio apart (I'm no good homebrewer), I just
did the extension mod - the one that allows hearing the frequencies
under 100KHz. I begin to think there must be some software problem,
because everything else works veeeeeeeery well - yesterday I was able
to hear some (very faint, indeed, and very disturbed) south american
radio, which is so rare here in Europe - on the tropical band.
Thank you and

Do you mean entried certain switches/keys combinations sequences of the DE1103 so as to reprogram for signals under 100Khs? (as mentioned by the Russian guys mentioned in this forum's files articles.) May be u can search the net or discuss such De-programing problem in this forum.

Yes, that's just what I meant. I thought that a complete reset would
do the job - in fact, as soon as I did it I found it was impossibile
to go down under the 100kHz - oh wait: it could be that only the
memories were gone. OK, then: is there any means that you know that
could de-program that mod?
I'm going to chase it down on the net.
Thx alot for your help

Try this "RESET" before figure out how to do any software de-
programing:
It works for most memory resides electronic devices(eg. car radio,
cordless phones, timers ....) but may not work for the DE1103.

1. Remove the batteries from the DE1103.
2. Put the batteries back a few days afterwards. Hope the memory
keeping capacitor(s) will then fully "Discharged" --residential
charges drained by itself.
3. Turn on the radio and hope DE1103 has reset by itself.
Good luck !

1241. Is there a definative FET test?

Yahoo group: de1103
Date: 2007-09-21 18:35:36 UTC
From: ramon_pax
Topic: 1241 Message: 1241

Since coming here, I have been worried that my FET front end has been blown. I am able to pick up what I guess are strong stations. I heard Radio Thailand last night on 5 MHz and Voice of Russia on 13 MHz using my long wire, and there was a lot of activity that I wasn't sure where it was from in Spanish Likely down South in Latin America. I get a lot of whistling
and static sound. How can I tell if I need to replace the FET? Also, could adding some sort of
impedence matcher on my long wire help, if so would a homebrewed torrioid or ferrite bar help?

1242. Re: Is there a definative FET test?

Yahoo group: de1103

From: knyuen88
Topic: 1241 Message: 1242

1. Try to compare the DE1103 performance against any "cheap" radio at the same location(s). If the DE1103 peforms even worst (sensitivity dropped noticably)than a "cheap"radio, it is almost sure that the FET was FIRED/gone !

2. Build an ATU(Antenna Tuner Unit) so as to optimize the matchings between than antenna and the DE1103.
Better avoid those ferrite bar type --- without effective shieldings they will pickup more local noise by its own ferrite bar rather than getting signals from the external outdoor antenna. Please see the Files folder of this forum (Schm_ATU.jpg). Also u will find other info about ATUs in the internet too.
Beware most unknown brand units advertised for SWL are gimmicks and does not worth the $ paid for (they may even cost more than a DE1103!)
Again a good/effective outdoor antenna (neither with nor without an ATU) may heighten the chance to "FIRE" your DE1103's frontend FET !

Hope it helps.

Also, could adding some sort of
> impedence matcher on my long wire help, if so would a homebrewed torrioid or ferrite bar

From: tagt_the_spellcaster
Topic: 1245 Message: 1245

Well, I know you all know there are times where your radio works best...but I just wanted to point out that:
if I try to listen to AM transmissions at, say, 3 PM, with the whip all in, in my house, perhaps in the center of a room, chances are that I'm going to receive nothing but interference, which may lead into thinking that the FET is gone.
BUT... if I turn on my radio at about 8 PM (or whatever; I mean, during sunset and in the dusk), extending the wire antenna well outside my home... well, chances are that the radio suddendly comes out with *LOTS* of trasmissions.
I know that you know... but if you think you have a burned FET, have you tried the Tagt Solution? :-)
Go out just after the sun is set, extend your wire antenna, turn on the radio... and listen.
I repeat: I know that you know, but... ;-)

Still suggest if you can make a performance comparision with a
CHEAP radio under the same situations (same time, same location,
same stations ....) to rule out any doubts. --- Just beware anything
unexpected .

Yes, that's a test I'm going to do this week end. First of all I have
to buy a cheap radio :) (there's a lot of chinese shops in my town...
it should be not difficult to have a 5 dollars AM radio there).
And should the test be... er... disappointing, I'm going to ask a
friend of mine to take out the soldering iron.
Thanks and

From: tagt_the_spellcaster
Topic: 1248 Message: 1248

OK, that's the good news: I just bought a cheap SW radio (10 euros, with cassette recorder and -non working :)- digital clock, batteries included) and I made some comparison. Well, NO comparison is possible, indeed :-)
The cheap radio can actually receive the strongest stations - and I'm happy with it: I can introduce my sons with this activity, without worrying that they break some important piece of equipment. I think such a cheap radio should be in every family's home.
But, and that's the best part of it, if compared with the DE1103, it's almost mute... some stations I can hear relatively well with the Degen, are absolutely inaudible with the cheap radio.
So, I'm twice happy :-)
Ciao a tutti

1249. LW/MW and FM ok, SW not. Is Q1 burned?

Yahoo group: de1103
Date: 2007-10-13 02:23:02 UTC
From: huelbeag
Topic: 1249 Message: 1249

Dear group,

a 1103 of mine has this behavior: everything seems to work ok, except shortwaves (1715-29999KHz) using whip or external antenna.

Would be this behavior caused by a Q1 burned? Would a J310 (yes! the silicon, normal-size, not-SMD) a good replacement (despite its physical size...) ?

I have checked the schematics. Actually, I am no electronics guy... but it seems signal for MW and SW are routed to Q6 (top left on the schematic, above TA7358). Before Q6 there is the attenuator switch S1 (on the mid-left).

Q1 and Q35 (top-left) are the preamp and switch for SW band (respectively). Q14 and Q3 are the preamp and switch to MW band.

Any comments will be much appreciated!

The Eham owner reviews are a help once again.

Now I can understand/appreciate some comments about operation weirdness, but Im not moaning as it is a great receiver.

After setting timer for 13 hour charge in order to use it, 30 mins later some fully charged batts were offered. In a curious rush to use radio, I disconnected psu and as you guys probably have already found... the internal timer carries on regardless and disables operation. A reset woke it up but I thought that could prompt people to say it was faulty and start screaming for a RMA lol

oh BTW, the supplied PSU has US 2 flat pins, but I found this fits ok into a standard UK shaver plug no worries.

After a few hours doing the "I wonder if it receives..?" mode, I don't see how you can receive FM on 27mhz, but thats no great loss (31Mhz fm is just being nosey)

Thanks for your postings guys, points noted re front end and static.

now to re-raise the HF antenna after a service (old atu will come in handy)

Have fun

I have a number of good to excellent shortwave radios (Sonys, Sangeans, and an Eton to mention a few) and I find myself reaching for the KA1103 (I have the Kaito version) a lot of the time. The sensitivity and selectivity are amazing for the price. It replaced my Radio Shack DX-398 (aka Sangean ATS-909) as my travel radio. Except for one that was given to me it is the least expensive. You made an excellent choice.

1254. DE/KA-1103 versus ATS-909

Yahoo group: de1103
Date: 2007-10-14 09:59:20 UTC
From: D.Kremp
Topic: 1254 Message: 1254

Hi everybody,
I bought a DE1103 some months ago and I must say it's a marvelous receiver if I consider the frequencies above 500 kHz. The LW band is very poor even if the whip-antenna is internally switched on ("disclosure" mod.). As I'm fond of NDBs (non directional beacons) which are to be found from say 200 kHz to 500kHz and as I wanted to use this small and handy Rx when I'm travelling, I'm more than a bit frustated.
I'm considering now to buy an ATS-909 but I'd like to know first of all if it's worth it.
Has anybody experienced both receivers side by side especially on the LW band ?
Thanks in advance.
Have a nice Sunday

Dominique

240v - Seller advert offers travel adapters but as I pointed out -
psu 2 pin fits UK shaver plug, so no worries for UK users.

Gotta go put hf vertical back up now - then I'll have my lovely
Kenwood TS480sat (and I wont resist making an unfair comparison)
The thing is, I have been listening to amateurs over the weekend on
all bands with a bit of wire in the bedroom.

For the few that dont know, there is lots of downloadable computer
software for decoding digital, cw, commercial air and sea
transmissions.

See eham reviews or a google search

Radio is still fun after all these years.

Have you checked the battery voltage? I just bought an Eton E10 (I think made by Degen); the supplied NiMh batteries were only .70 volts and wouldn't run the radio or charge inside it. I charged them on a separate charger and now everything is normal.

I own both (actually the identical Radio Shack DX-398 and Kaito KA1103) but haven't tried either on LW. Using the internal antennas the KA1103 is much more sensitive than the DX-398. It works poorly without external antennas. This is a common complaint. The battery life is very short.

In France there should be many strong signals on SW so the whip might be all you need. I live in California and there are lots of weak SW signals. It's an excellent radio when using a passive loop for MW and a short wire for SW. The KA1103 has replaced the DX-398 as my travel radio.

Dominique:

I am the proud owner of both a ATS909 (actually a Radiolabs Super 909) and a KA1103. I like them both. A lot.

In a true torture test, at high noon (12:30p, local time) on longwave, I came up with the following results..

My location: Sacramento, California, USA

Station: PBT NDB, Red Bluff, CA
Freq: 338Khz
Power: 400 Watts
Distance: 119 miles / 192km
Mode: AM

ATS909 KA1103
S-2 Zero

My location: Sacramento, California, USA

Station: FCH NDB, Fresno, CA
Freq: 344Khz
Power: 400 Watts
Distance: 156 miles / 252km
Mode: AM

ATS909 KA1103
S-1 Faint/Unintelligible

Both radios were using only the supplied whip, running from AC power via a wallcube.

Hope this helps!

1261. Low sensitivity on the whip, Sometimes

Yahoo group: de1103
Date: 2007-10-15 14:49:13 UTC
From: Phil Pasteur
Topic: 1261 Message: 1261

Hello all,

It seems that I might have read something about this before, but a search did not turn up anything.

I notice that when the radio is running on battery power the AM sensitivity across all bands is low when the radio is sitting on its stand. If I pick it up and wrap my hand around the left side of the radio, reception improves significantly. If I plug in the AC adapter, reception is good and does not change when the radio is handled. Touching the antenna directly doesn't seem make nearly as much difference

It would appear that handling the radio must use my body as a kind of ground perhaps capacitively (maybe inductively?) coupled or something similar.

My radio is the KA1103. It is one of the early models and is modified with both the audio resister mod that many of the early radios seemed to need, and I installed the Diode mod that I got from Kiwa to protect the front end from static that can be introduced through the whip.

I would like to know if others have seen this behavior and if anyone knows what might be causing it. It also would be nice if I could find out how to fix it.

Hi Phil,

I agree with you about what you are experiencing. I must say I was about to post a question concerning that !

My DE1103 is'nt modified at all, I have neither the audio resister mod nor the diode one. I don't know the reason why the sensivity improves when I wrap my hand around the left side.

Does anybody have any explanation ?

Dominique

Objet : [de1103] Low sensitivity on the whip, Sometimes

Hello all,

It seems that I might have read something about this before, but a search did not turn up anything.

I notice that when the radio is running on battery power the AM sensitivity across all bands is low when the radio is sitting on its stand. If I pick it up and wrap my hand around the left side of the radio, reception improves significantly. If I plug in the AC adapter, reception is good and does not change when the radio is handled. Touching the antenna directly doesn't seem make nearly as much difference

It would appear that handling the radio must use my body as a kind of ground perhaps capacitively (maybe inductively?) coupled or something similar.

1264. Audio Distortion, 1103 and Eton E5

Yahoo group: de1103
Date: 2007-10-15 19:46:17 UTC
From: old_speaker_guy
Topic: 1264 Message: 1264

Hi all,

I bought an 1103 that had the audio clipping issue that a number of the earlier units suffered from. Changing the resistors to knock down the gain did the trick, as commented on by others. Well, more recently I picked up an Eton E5 as the Toronto "The Source" stores were closing them out at $69.95. It also suffers from high distortion although the characteristics are a little different.

It seems more related to the volume control and its steps. At volume settings of 7 or less the distortion seems to climb a lot. This is a problem with headphones where I typically use a pretty low setting. Does anybody know anything about this? I thought the 1103 and the E5 used the same RF/Audio board (obviously the control boards are different) but the E5 has a 32 step volume control and the 1103 has a 64 step control, so there must be at least minor differences.

Any idea if the gain reduction trick would work on an E5?

Thanks,
David

Dominique & Phil

The whip isn't used on AM bcst.band.
The AM antenna is a ferite antenna (probably on the left side of the radio).
If you had read the instruction manual you would have found this out.
It is directive and you should rotate the radio for maximum signal.

It would be interesting to see what sort of results are available with a coupled loop antenna for both of the radios in the daytime test, probably because I don't want to have to buy a dedicated lw receiver, at least not yet.

Greg,

At LW frequencies reception is via the built in ferrite rod, not the whip. I hope you were orienting each radio for best reception in each case. I mention this because although I don't listen to LW I find the KA1103/DE1103 to be so much more sensitive than the ATS909 on MW and SW that your results surprise me.

George,
I am not sure how you got the fact that I was talking about MW/BCB reception from my original post. I did not specifically mention that band at all.
If you had read my post carefully, you would have found this out.

Here is the quote:

"I notice that when the radio is running on battery power the AM sensitivity **across all bands** is low when the radio is sitting on its stand."

In any case, I suppose that I should clarify this so that others do not misunderstand what I am asking about.

My SW listening is predominantly AM on whatever band that might interest me, this includes all of the SW bands AND MW/BCB!
SW uses the whip (and there is a hack that allows the whip to be used for BCB/MW reception as well).

The change of sensitivity that I am talking about occurs during SW reception of AM signals on all bands when the radio should be using the whip.
I would suppose that it happens with SSB reception as well, but I have never tried it to verify this. Because I said AM initially, I did not intend for anyone to think that the problem was only occurring on MW/BCB. Quite the opposite, I noticed this a few days ago when listening to WWV on 5000 and 10,000 kHz. These frequencies, if the radio was operating as it is supposedly designed to, would certainly be received using the whip.

Phil P.

Dominique & Phil

The whip isn't used on AM bcst.band.
The AM antenna is a ferite antenna (probably on the left side of the radio).
If you had read the instruction manual you would have found this out.
It is directive and you should rotate the radio for maximum signal.

George K2EWL

I notice that when the radio is running on battery power the AM sensitivity across all bands is low when the radio is sitting on its stand. If I pick it up and wrap my hand around the left side of the radio, reception improves significantly. If I plug in the AC adapter, reception is good and does not change when the radio is handled. Touching the antenna directly doesn't seem make nearly as much difference

Topic: 1261 Message: 1272

I have the "hack" employed on my DE1103, mostly because I like to monitor 160 meters, which is at the high end of the U.S. broadcast band and I haven't really noticed a drop in sensitivity when running straight off battery. But I have noticed that movement of the whip either increases or diminishes the signal strength, but then that's normal on all bands. With the hack programmed in, the 1103 does operate off the whip and bi-passes that ferrite antenna designed for the broadcast band and works if you plug in an outside antenna as I do most often.

From: Jordi Brunet
Topic: 1273 Message: 1273

Hi to all, a friend´s Degen DE1103 has been dead, the radio can´t operate and only the clock and battery charger are OK, I make some resets and the radio continues off, ideas to repare it??? 73+DX!! Jordi Brunet

1274. FM Selectivity problems

Yahoo group: de1103
Date: 2007-10-21 20:49:28 UTC
From: djkrikke
Topic: 1274 Message: 1274

Hi,

I've ordered my Degen de-1103 a few weeks ago and received it without any damages. The first time the radio operated, FM selectivity was really good, even long-distance fm stations could be heard without problems! But, after changing the batteries, every station below <88 mhz was gone. There was also a reduced selectivity on the whole fm band, only 3 stations going in to stereo without problems.

Now, when my father got the degen into his hands, he did something magical (only touched the antenne and turned it a few turns), and suddenly there was a perfect receipt again.

The radio was working the whole day with high selectivity, but a few minutes ago I changed tot the MW band, changed again to FM, and the stations disappeared again!

Is this perhaps a known problem with a (known) solution?

PS: these stations aren't pirate station and they were still broadcasting at the moments I couldn't receive them, also every other station wasn't going into stereo.

1.Try to RESET the receiver according to the manual.
2.Several times move narrow-wide (news-music) switch, there is a "deaf point" between the two right positions, select thoroughly music or news, (avoid the middle point!).
3. Several times move thoroughly Local-DX switch, to the position-DX.

Good luck!

Thanks for your reply.

Seems like none of these suggestions actually worked, even when
moving the narrow/wide & local/dx selections powerfully.

The radio was checked before sending and everything was working well,
so I assume that the problem is caused by transport and results in a
bad-connection problem inside the radio. All other bands are still
working without any problems so it looks like only fm has selectivity
errors.

It hurts to see the radio work *very* well, receiving more stations
i've ever seen and then suddenly fail on every fm station around.

PS: I also tried using the adapter, but nothing changed.

Are there perhaps other suggestions?

From: ak7dx
Topic: 1280 Message: 1280

Just got comfirmation of delivery next week of a KA1103 and KA33 ANT for Radios4You in Flordia.

Anyone dealt with this US Degen vendor before?

I have owned a SONY ICF-7600GR, 2110, 77 and 55 at various times along with numerious high-end military comerical HF rx's over the last 1015 years. Now I hope I'll be happy with just a small rx for travel and home listening. After reading numerious reviews from e.ham and other sites other than occusional dud and ergonomics issues it would seem to be agreat rx.

73 and good DX'ing

I've gotten three radios off of them, one of which is a 1103 ....with a
warranty. I already had the Degen version from China, so when the front
end went, well you know, fix it or chuck it. It's an easy fix with the
files provided by this group. I enjoy both of mine. Good luck. Jerry.

I've ordered two from them -- one last year and one a few weeks ago when the first one got a static shock and blew the FET for AM. Quick shipping, great packaging.

I bought mine from Radios4You on eBay and it arrived in just a few days. I own some excellent radios (Sony ICF-2010, ICF-SW7600GR and Radio Shack DX-398 aka Sangean ATS-909) but the KA1103 never ceases to amaze me. I bought a 7600GR about three months before the KA1103. Now I only use the 7600GR when the synchronous detection is needed.

From: ak7dx
Topic: 1288 Message: 1288

My 1103 and KA-33 arrived from Radios4you about an hour ago via UPS
Good packing, radio worked right after batteries were installed. Solid
construction looks like a keeper.

Am listening on 40 meters @ 7210 LSB K6SOL in QSO with Seattle ham
(callsigbn unk) with the KA 33 antenna and also on the whip fully
collasped and locked in the radio!

Impressive I must say. The multi buttions willtake a bit to get used
to. Also my Nimhd batteries are 1200ma and green no writing.

73 and good DX'ing

Topic: 1289 Message: 1289

Previous post my 1103 and KA-33 arrived today.

Who has had good luck with a protective case?

Any suggestions or a protective carry case? maybe a small Pelican
(probably more the the radio and antenna combined)

Maybe a surplus store? a case that you can carry the antenna and
little parts and the radio and some spare batteries.
73 and good DX'ing

While the antenna isn't bad, I have not really seen any great improvement over the whip or a long wire. Maybe I am not using it right. I have heard that an impedance matcher can improve both a long wire and the KA 33 but I have yet to successfully try it. (I have been trying to jerry rig one instead of actually gluing the windings down and soldering the 1/8 mini females to the winding wires. I may also not be using the right ratio of windings. Also, I have no ground. I used myself and it helped a little bit, but still not so much that I
needed to use the KA 33 instead of the whip. If you find a way to get more out of the KA 33, let me know. ^_^

I have the KA31 (shortwave only) and I don't get any improvement when using it. I don't think it's defective. There's only one place I can hang it but perhaps if it was pointing in a different direction I might see some improvement.

1292. KA-33 results/comments

Yahoo group: de1103
Date: 2007-10-31 15:04:26 UTC
From: ak7dx
Topic: 1292 Message: 1292

Yesterday afternoon after unpacking the 1103, and starting the battery charging process (have 9 hours left this am for full charge after all night) plugging in the KA-33 resulted in dramatic improved in reception so much so I had the use the local/dx switch.
Memory seems easy to use after getting used to the functions.
Not knowing the KA-31 previous performance but sounds mediocre. Degen may have done their homework and improved the antenna as the 31 is discontinued and the 33 does have a MW ferrite bar antenna that attaches to the radio via a Velcro strap. A small switch on the amp selects either SW/MW. Seems well made.

Bottom line the KA-33 may be much improved over its predecessor plus the addition of MW reception. Overall, the radio is very good as compared to a ICF-SW7600GR and YB-400, too bad no sync.

Now on the travel case....

73 and good DX'ing

I have found really good cases, packs and bags at discount sporting goods stores and military surplus places. You might want to look at some of the rubberized bags for fishing gear, or even some of the smaller ones for toting fish around in.

There's an over the shoulder satchel that I use instead of a wallet, and with some sort of waterproof cloth wrapping over the radio, that might be just the ticket for traveling. Once my radio gets here, I am betting I can fit it, extra batteries, the DE33 antenna and a notebook into my satchel without much of a problem.

I carry my Degen DE1107 radio (exactly the same size) inside a Pelican 1060 micro case.

http://tinyurl.com/2ww5ke

(free shipping to Canada!)

I have a small satchel of dessicant silicone and a micro fiber cloth (I found one the exact same color as the yellow rubber lining) wrapped around the radio to keep it from rattling around in the case.

It works perfectly.

1296. Charger RF Noise

Yahoo group: de1103
Date: 2007-11-05 20:10:21 UTC
From: Nathan Karras
Topic: 1296 Message: 1296

Has anyone had experience with RF noise with the charger?

I am not exaggerating when I say that it produces more than enough noise to cut out more than half of stations, and that it's more or less through the entire SW range. I've tried connecting it to different circuits, as well as through a filtered power device that I use on
other radio equipment, to no avail. I'm about to use a ferrous torroid to try to cut this down,
and will post as to whether or not it works, and how well.

This is EXTREMELY annoying, and disappointing.

I also have similar problem when connecting the audio lineout to a computer's line in. I've tried a few computer, with varying degrees of noise. Even my PowerBook G4 (seems to be the quietest of them all) makes a LOT of HF noise, ot the point that I can't do HF FAX or monitor
RTTY or other digital communications. I know there are a couple ways I could modify my radio, but I would rather not do that. Due to the severity of this noise, I am not sure a "choke" device would work very well. The interference does not change significantly using the computer with or without its charger. Radio is without charger.

Yes I have,

You must use the original transformer that came with or exact spec replacement. Apparently these other ac dc adapters are not filtered as you expect. Also the radio doe not really need to be driven with a higher amperage device. Other adpaters may have a little too much for the unit to handle and the filtering capabilities are not what you expect..personally by my knowledge it is a more of a chore to filter a stronger more higher amperage adapter.

In any case look at the adapter specifications and stick with that. Also it would not be surprising that the radio itself may dislike any more amperage fed into it even though radios take whataver they need that is not always true sometimes they take more then they can handle!

I am using the factory charger.

I am just resorting to running it off of batteries until I can get a couple of ferrite torroids
to try filtering it with.

I don't use the charger because of the noise. I always run mine off NiMH
cells, and recharge them in a charger, not in the radio.

1303. AC Adaptor Not Sensed

Yahoo group: de1103
Date: 2007-11-10 20:33:39 UTC
From: ke8wo2001
Topic: 1303 Message: 1303

Had my DE1103 for about nine months. Have been charging the batteries in the 1103 maybe once a month. About a week ago it needed a charge so I plugged in the AC adapter that came with the radio. Nothing happened .. the normal indication of the back light coming on and the AC power adapter icon appearing in the display did not happen.

I tested the voltage coming out of the adapter and measures about 12.5 volts. Tried another AC adapter with the radio ... still nothing happens with radio. (The radio still works fine off the batteries with the adapter plugged in.)

Tried reseting the radio .. no change.

Anyone have this happen. The adapter was a little hard to plug in from day one. But just wanted ask if others have had this sort of situation show up before I tear into the radio. Perhaps the AC adapter socket has failed.

Thanks in advance.

(Hope this is not an old topic .. searched high and low and found nothing.)

1305. Wall Warts

Yahoo group: de1103
Date: 2007-11-11 23:23:26 UTC
From: jackfsanders
Topic: 1305 Message: 1305

This complaint/problem/suggestion is not peculiar to the 1103, but a hunt for the right Kaito wall wart today prompts this recommendation.

I have a 1103 and a 1102. The 1102 needed charging for the first time in a long while, and I went looking for the right power supply. The problem is, I have more than a dozen of them, for all kinds of gadgets from GPS units to cameras, marine radios, scanners, ham equipment, etc.

And rare is the wall wart that has the same brand name as the unit it powers. That includes Kaito/Degen products. (Both Kaito radios, though the same size and similar operation, use different but similar shaped power supplies, one six volt and one eight volt, so finding one power supply did not help with both radios.)

While I have stuck labels on many supplies to identify what equipment they power, the label for the 1102 had popped off. So I wound up spending 20 minutes trying to figure out which was the right wall wart from two dozen in the "shack."

My suggestion (which is probably nothing new): As soon as you buy any electronic equipment that comes with a separate power supply, label that supply. And don't rely on self-stick label; their glue tends to dry up under the heat of the power supply and pop off. Affix the label with good quality transparent tape and wrap the tape all the way around the unit.

If you have an etching tool, use that! An etched label will never fall off!

73,

=jack, K1IFJ

This is a good suggestion and one I've seldom seen mentioned. As a collector of sorts I have a storage bin full of seldomused wall warts...probably more than 50 of them. I bought some of those little price tags with the strings on them and warp that around the cord right near the wall wart itself. That system has worked and I don't have to permanently mark the wallwart in case I ever sell the radio.

You're right...none of these things ever identify the equipment they're designed for and this is becoming a larger problem. Funny too since cell phone chargers and car adapters usually carry the manufacturer's name. The OEm's ones anyway. My cell phone home charger says LG (the phone manufacturer) and teh car charger says Verizon..no mistaking those.

Speaking of Wall warts the one that came with my DE1103 distorts SSB reception. SSB reception is normal with batteries. I have tried using another brand with the same result. Can anyone recommend a power suppy with enough filtering to eliminate this problem.

I gave up on most wall-warts some years ago when I realized how good NiMh batteries had gotten and bought my first two sets of 15 minute rechargeable batteries. You might want to write the manufacturer and complain about the unit that came with your radio-sometimes that gets results, but lots of companies like saving a few cents by not having a fully filtered
power supply.

1309. Wall wart problem

Yahoo group: de1103
Date: 2007-11-14 13:58:20 UTC
From: John
Topic: 1309 Message: 1309

I received my 1103 several weeks ago so far very impressed as compared to a SONY 2010, SW-77, SW-55, SW-7600GR all I have owned at one time or another even my GRUNDIG SAT 500 and 700's.

Now keep in mind the comparison is relative to the price and features, for the $ the 1103 can't be beat.

Now to the heart of the matter:

My wall wart neither distorts SSB nor gives me any hum or issues with reception. It would seem Degen/Katio does their homework and takes into account customer comments. However, mine has had no issues as described above.

John

I have the same problem. Have you also noticed that your Ni-Cad's never seem to be fully charged???

My solution was to run the radio on batteries only AND recharge your batteries in an external charger. You get no hum and your listening time is much longer.

1317. Eton E1 XM at Circuit City for $225.00 shipped

Yahoo group: de1103
Date: 2007-12-11 15:50:30 UTC
From: mbrenner99
Topic: 1317 Message: 1317

For anyone looking for a unit with Sync and Pass Band Tuning CC has a big sale on the Eton E1. I hear New Old Stock items but a heck of a price. I have two 1103's but have one of these on the way now to replace my 2010 as my "large" radio.

The E1 has a reputaion for good performance and some quality control issues (sound familiar). Eton will repair them if there are warrenty issues as CC is an authorized dealer.

These are much larger than the 1103 and take 4 D cells (rather than our 3 AA) and you aren't
going to easially slip on in your pack for travel like I do with my 1103 but for more advanced
listening could be a bargain.

I am not associated with CC or Eton.

Well, after re-reading the post and observing carefully the pictures,
it is now clear to me that indeed he did not replace the original
encoder of the receiver by the mouse's scroll wheel, as I erroneously
assumed, but he just installed the encoder inside the mouse's case.
So this procedure will not cure the eventual failure of the encoder.

Even if this operation could be technically feasible, electro-optical
encoders such as those used in a scroll wheel may have a substantial
electrical consumption, not appropriate for a portable receiver.

BTW, is somebody aware of a source of spare encoders for the DE-1103?
I understand that the encoder sold on ebay by tquchina is not
appropriate for the newer versions of the receiver

Have you emailed tquchina about this? I was going to suggest him as he was mosdt helpful with the items that I bought from him, a DE1103 & spare whip antennas. Is the encoder prone to failure?

No, I haven't e-mailed tquchina about this
subject, but I think he is aware of the problem,
perhaps there is not a market for spares of the newer encoder.

It has been reported by several DE-1103 users
that problems developed in the encoder after some
time using the receiver. Apparently older
versions of the receiver (those with a
metal-shaft encoder) were prone to this kind of
failure, but supposedly the manufacturer changed
to a better encoder. The latest versions of the
receiver have an encoder with a black plastic
shaft, possibly Alps brand and I have not heard
of any problems with this one. The encoder sold
on ebay should replace those older metal-shaft encoders but not the newer ones.

Both of my DE-1103 have mainboards marked as Mark
IV, both have the plastic-shaft encoder, and so far have developed no problems.

Anyhow, it seems obvious that a
electro-mechanical encoder is a weak point and if
one cares about the receiver and wants to keep it
in operating condition for a long time, would
like to have a source of spares for the weakest components.

Mea culpa, I didnt look at the images closely enough.

Still, a mouse with its own power supply might be a useful substitute for the encoder.

Years ago Arthur C. Clarke wrote a novel where the fundamental principle behind all technology was-

"No truly advanced machine has any moving parts."

Seems like a good design criteria.

Mark IV? I thought there were only three versions of the DE1103, the third being the grey plastic model sold on eBay.

It would be nice to see a list of the changes since Mark I, along with performance stats.

I have bought a Degen DE-1103 about one year ago
(from the factory) and a second one a few months later (from ebay).

Both have a good sound when listened to through
earphones or external audio system, but they
sound just adequate through the internal speaker.
I think it is just a matter of a cheap loudspeaker in a small case.

I do not mean that the sound is distorted, just
"small". By way of comparison, my old and
venerable Sony ICF-7600DS which is roughly the
same size, sounds much "bigger".

I understand that there was an issue with some
production lots of the 1103, where resistors of
erroneous values were installed in the audio
circuitry resulting in distorted sound, but to my
knowledge that has been solved long time ago.

Hi Moises
Thankyou for the reply. I may pick up a new 1103 in the next few days and was hopeing the destortion issue had been resolved. It sounds like it may in fact be an issue on older models so I may go ahead and purchase it. I have a G4000 and a ETON E5 and the sound is so much superior on these models that I hardly ever use the 1103. Other than the sound quality the 1103 is a great radio.

Regards

I own both a 3 -year old DE1103 and a younger, but very similar, Eton E5.
Both have very good audio for that small a speaker.

Well, that was on october 2006. I contacted them
through the e-mail address appearing on their
website, i.e.
<mailto:tecsun@...>tecsun@on-nets.com
(perhaps they have a trade agreement with
Tecsun?) that is located in Hong Kong. The seller
was a lady called "Esther" who was very polite
and patient answering my questions. The total
price was a bit higher than on ebay but at that
time I preferred it that way. They shipped by
registered air mail, with a tracking number of HK Post. No problem at all.

I purchased the second one from tquchina on ebay

Merry Christmas!!

Mine's a Apr '04 model. IMO, it's pretty normal sounding for a radio this size. I can't say I have heard any noticeable distortion up to volume 45. Pretty much the same quality as my Sony ICF-7601.

I have two Kaito 1103 radios. The audio is nice on AM (MW and SW) but the FM is distoted. Both radios have this issue, headphones and speaker. You can really hear issues with headphones, even at low volumes. I sent my first one back to Kaito and they sent a replacement but it was identical. I purchased one a few months later and it was exactly the same. You can really hear this with highly modulated stations. So a classical station or a staion like NPR that is not hightly compressed and therefore modulated near the limits of allowable deviation will sound okay but highly multiband compressed music stations will be not sound very good. In Los Angeles 93.1 FM is an example if a highly modulated station. It sounds quite poor on the 1103 (I have tested three of them). It is not an MPX demod issue because switching the radio to mono does not clear it up.

I have tested this against similar Sangean radios and also my Etons and they operate as expected.

I don't know if the current 1103 production is better I hope to get hold of one some day and see. Other than the FM issues this is a nice radio.

Hi,
the new 3-rd version of DE1103 has the same sound quality on FM as the older versions. Better sound quality on FM has the receiver with mp3 from Degen production DE1121 (good stereo, clear, bass) . DE1103 is meant for very sensitive AM reception primarily.

mbrenner99 <mbrenner99@...> wrote: I have two Kaito 1103 radios. The audio is nice on AM (MW and SW) but the FM is

Highly suspect it is not the DE1103's faults but a FM propagation problem. (Interference for Long-Delay Multipaths in Digital Terrestrial Broadcasting Reception)
The symptom usually shown as double immages(ghosts) in TV pictures and distorted sounds.
If this is the case. Try to move the DE1103 to different locations. (preferably far from your present reception locations --- try pickup the questionable stations out of town.) and compare the outcomes.
Hope it helps.

The issue with my 1103s are not due to multipath. I have tried it in a number of locations and have used it next to other radios. I suspect that the FM section on the 1103 is set for a narrower deviation than peak deviations that are broadcasted .

1341. AC Supply noises

Yahoo group: de1103
Date: 2007-12-22 20:35:29 UTC
From: enriqueeeeee2001
Topic: 1341 Message: 1341

It is a week ago since I purchased the Degen. I cracked it open and had a look. The electronic board was stamped M03 MKIV.
The seller claims that the receiver is the 3th generation and sound, sensitivity have been improved.

I have noticed that resistors 223, 224 have the marking 222 so I am going to do the Kiwa mods.

By the way, ac adapter add considerable noise. I have tried plugging the adapter in other AC outlets as well but results are the same.
Anyone else having this problem?

I have even used my sony icf sw7600 adapter and result is equal, noises.

Even unplugged dc cable act as antenna!!

I am going to shorten the cable to see if it works.
Next week I will buy some ferrite toroids. Next step will be extra shielding.

With batteries works quite good, it runs almost neck by neck with my Drake R8b.

The model of the charger is SY-EI35-06300

Comments are very wellcomed !!!

1342. Are the electronics in the G5 same as in Kaito/Degen 1103????

I think the cutout which disconnects the batteries when you plug in
the AC adapter has gone bad.

I believe the radio circuitry is essentially the same. The G5/E5 has several ergonomic improvements, such as dedicated volume controls, better memory access and more useful display screen. I own both a DE1103 and an Eton E5, and can report that their sensitivity, selectivity and audio sound almost exactly like each other. It may just be my imagination, but the BFO flywheel may work slightly better on the E5.

With the bargain prices on E5s and G5s on eBay, it's probably a worthwhile investment.

Thank you for the answer. I have already ordered the G5. I wanted to get the DE1103, but if it has the same internal circuitry and performance as my G5, I can hold on for a while. By the way I think I would have liked the 'analog' display of the DE1103 better!

Yeah, I kind of liked the retro look of the simulated analog dial on the 1103, but the more standardized keypad made possible by it's removal was a real plus for getting the E5.

1347. Cleaning encoder

Yahoo group: de1103
Date: 2007-12-26 04:23:55 UTC
From: tantywee
Topic: 1347 Message: 1347

Thought I'd just mention my very lazy but reasonably effective way of keeping the original "skippy" encoder problem at bay. I do this every few months whenever it starts skipping again.

Use a quick evaporating contact cleaning spray, NOT WD40-type general lubricant spray as they will leave some residue.

1) Remove the tuning/encoder plastic knob.
2) Hold the encoder stem facing upwards.
3) Spray downwards onto the threaded side of the stem. Give it a good blast and let the fluid drip in.
4) Put the knob back on and give it several good spin in both direction and you are done.

Hi,
I have a Kaito 1103 right by the bedside connected to a wire near the window. It works as well as the Grundig YB-400 and the Sony 7600 GRS. A good radio for the money and the ergonomics are no problem at all.

I have never understood why Passport to World Band Radio makes a huge deal about the ergonomics. They are easily worked around.

If anyone wants to have some cheap fun (not that kind) buy yourself (Santa brought me mine) a Sony SRF-59 Walkman for less than $20.00. It is extremely impressive on MW and there is no FM intermod in Los Angeles despite being extremely sensitive. It is analog, has no speaker, the headphones are quite decent and it uses only one AA battery. 99% of the time it keeps up with 1103. I have not compared it to anything on FM.

Some people simply do not like any deviation from the way their preferred radio is operated. It is a bit of a change to go from, say, an R390 to a fully digital radio, and some
people choose to not make such a drastic change in the way they tune stations and adjust the set, and will form their entire opinion of the radio based on how closely it resembles the radios they are most comfortable with.

1352. Leaving the batteries in the radio

Yahoo group: de1103
Date: 2007-12-26 16:43:27 UTC
From: kshepher413
Topic: 1352 Message: 1352

Has anybody suffered any negative results from running on the AC adapter while the rechargeable batteries are left in the radio. I know it's not a problem with the YB-400, but the manual for 1103 advises against it in the regular battery section. The don't have a specific warning concerning the rechargeable batteries.

Thx,

Kevin

There are a few folks on the amateur radio help group on Yahoo that
might be able to do this. Possibly, maybe, Kiwa, the company that
modifies the audio in the 1103 might be able to do so, though I
haven't seen this service listed.

How old is your radio? Have you contacted the vendor?

1356. KA 1103 fading in and out??

Yahoo group: de1103
Date: 2008-01-01 21:00:16 UTC
From: jtricer1973
Topic: 1356 Message: 1356

Hey guys, just got my KA1103. I also have a KA 1102. On shortwave and AM the 1103 seems to have trouble "locking in" on the signal. It tends to fade in and out. Not all the way out but out some which makes it hard to listen to. When ever I run in to this I have pulled out my 1102 and did not have this problem. It seems to lock in better with less of the fading in and out.
Couple this with the fact that I think the 1102 has better sound and it seems the 1102 is a better radio for shortwave and AM. Any comments. From what I had read about the 1103 I expected it to be quite a bit better than my 1102 but so far this has not been the case and I end up listening to the 1102 while the 1103 collects dust. Something wrong with the 1103? Maybe a bad batch? Any ideas would be appreciated.

Thanks guys

Hey guys, I am still doing alot of shortwave listening and comparing my 1103 against my 1102 and have come to a new conclusion. I don't think it is so much as the signal fading in and out on the 1103 as the fact that there is an awful lot of background noise that is usually not as bad on the 1102. I have also noticed if I take my index finger and rest it on the base of the antenna it cuts out tons of this noise.

I know there are some mods being done to cut down on noise so maybe this is what I need to do. Any comments welcome.

Thanks guys

My KA1103 has a very low noise floor so yours might be defective although I don't have an 1102 to compare it to. Are the signal strengths (ignoring the higher noise on the 1103) about the same on both?

Thanks for the replies. After alot of comparison, I would say the 1103
is more sensitive. Some things that I get just off of the whip on the
1103 requires the external longwire antenna on the 1102. I am about to
the conclusion that it is a noise problem on my 1103. I mean I can
hardly stand to listen to it. Bear in mind that with stronger stations
it is not really a problem though it is still noisier than the 1102.

I guess to sum it up, on my 1103 the signal to noise ratio is
terrible compared to my 1102 although the 1103 is still more
sensitive. The noise is so bad that I can barey stand to listen to it.
I got it from radios 4you, wonder if I can swap it or send it to Kaito
USA for replacement?

I guess to sum it up, on my 1103 the signal to noise ratio is terrible compared to my 1102 although the 1103 is still more sensitive. The noise is so bad that I can barey stand to listen to it. I got it from radios 4you, wonder if I can swap it or send it to Kaito USA for replacement?

That's where I got mine (via eBay). Your 1102 should not outperform your 1103.

Could this be the "famous" noise problem from the AC adapter?
Does the noise occur when the radio is operated on battery power only?
Also, do you have it near any computer equipment?

Hey guys, this is using batteries. It is kind of close to my PC but still, if it is electrical noise it doesn't seem to bother the 1102 nearly as bad. Maybe since the 1103 is a more sensitive radio it is more sensitive to noise as well. It does seem better outside. I am just going by my comparisons in my house. Also I would like to say that I find all the ergonomic complaints about the 1103 to be exagerated. I find it easier to use than my 1102 and the volume control doesn't bother me at all.

My 1103 picked up huge amounts of noise in my inlaws' house - turned out to be those touch-sensitive lamps that use body capacitance to control. Found this out by the time-honored "start unplugging stuff and see what happens" protocol :-)

If you're referring to the lower wattage fluorescent bulbs I have them all over the house and I don't have any noise problems.

Try turning off one circuit breaker at a time and see if the noise gets weaker or maybe even goes away. If that happens your search for the source of the noise will be a lot easier. As mentioned earlier those touch-on lamps put out plenty of garbage; so do light dimmers.

Topic: 1356 Message: 1372

I put in a bunch of the compact fluorescent lamps (CFL) awhile back. They make all kinds of noise. I put four of them (35 watt) in my overhead fixture in my kitchen. I used to listen to my portables at the kitchen table with fairly low noise levels. Now, if that fixture is turned on it gives me S9 noise levels on some frequencies. Turn it off and noise levels drop typically to below S1 to S2. Even in my shack some 60 feet away, I know when someone turns that fixture on. I had an old model 15 watt CFL in a lamp on my night table. It made the radio next to it (CC+) almost unusable for anything except local stations. I replaced it with a new 35 watt CFL and 90% of the problem went away (I still know easily without even looking whether that lamp is on though). It seems that it varies from one manufacturer to another, and even from one lamp to another when they are built by the same manufacturer. Bottom line is, you can't just ignore those damn things as a potential noise source.

Phil

Ok, so I pick up my 1103 to walk back to my bedroom and as I am walking down the hall the antenna falls out and lands at my feet!! It apears to just push in and be held by friction but now it keeps working itself loose. Any ideas or comments? I am very disapointed about this. Maybe I should send it back for replacement.

Replacement antennas as well as back stands (a
part also prone to break) can be purchased on
e-bay, tquchina and liypn sell them.

Antenna is attached with a small screw. Have a look whether you have
it. Maybe it has been forgotten to be assembled.

What about the audio on shortwave? Is it a little bit distorted?

OK, I checked the screw and it is there and tight. The antenna
actually came apart from that piece which is held in place by the
screw, if that makes any sense.

So, unless your radio is covered by a warranty, you will need to buy
a replacement. I doubt it can be repaired, however you may try to fix
it by pressing on the "grooves" in the base with some kind of pliers
or by gluing it but I doubt it will last for a long time. Drilling a
hole and passing a screw could help, but would not be nice to see.

I have heard that these antennas are weak and that explains that
there is a market for spares.

From my point of view, I think that Degen workers did not realize in
putting the screw in the antenna.
It is very easy to check it, remove back part of the main body. You
will need a thin screwdriver. I think that there are 8 screws, do not
forget one inside the batteries' box.

As I was warned by a radio friend who also owns the Degen, "don't play with the telescopic antenna". I've expanded it only in few occasions, since I noted that in my case FM signal -also when is from DX -is enough. There are or were until recently when I searched, replacements in eBay.

I think one thing to remember is that these radios are built to a price and judging by the price of these sets, the quality of the antenna would be mediocre at best. Best idea would be to try and find one that will fit from a different source.

My experience with the KA - 1103 while using the telescopic antenna on shortwave has been less than impressive.

From my point of view, I think that Degen workers did not realize in putting the screw in the antenna.
It is very easy to check it, remove back part of the main body. You will need a thin screwdriver. I think that there are 8 screws, do not forget one inside the batteries' box.

Hey guys, are you saying there is another screw inside the radio holding the antenna together that I can't see from the outside of the radio?

Horacio Nigro <hanigrodx@...> wrote:
As I was warned by a radio friend who also owns the Degen, "don't play with the telescopic antenna". I've expanded it only in few occasions, since I noted that in my case FM signal -also when is from DX -is enough. There are or were until recently when I searched, replacements in eBay.

So, unless your radio is covered by a warranty, you will need to buy
a replacement. I doubt it can be repaired, however you may try to fix
it by pressing on the "grooves" in the base with some kind of pliers
or by gluing it but I doubt it will last for a long time. Drilling a
hole and passing a screw could help, but would not be nice to see.

I have heard that these antennas are weak and that explains that
there is a market for spares.

I didn't buy mine from them, but it plugged into the antenna jack socket. I
used the past tense, because my cat ate it. 8-(

1390. Battery drain: DE1103 v G5

Yahoo group: de1103
Date: 2008-01-08 05:35:24 UTC
From: mjavid2002
Topic: 1390 Message: 1390

Has anyone measured this and compared to the G5 which is supposed to be the same electronics packaged different? As per a post on battery life in the archives, drain was 265 mA, which really seems crazy high as I have measured 200 mA (without light) on my E1XM.
Thanks,

M Javid

I bought mine directly from Kaito on Amazon, and it came with a "bundled" longwire antenna and the "free T1 reel antenna". Both of them have 1/8" plugs on the ends for the external antenna jack.

Speaking of, is the only way to get better FM reception to use a clip-to-antenna extension? Neither of the longwires seem to help reception when plugged into the external jack.

Bill

Thanks much for the information, folks. I ordered my 1103 today. This is the first shortwave/longwave radio I've ever purchased, and am looking forward to listening to radio outside of the States.

How long is shipping from Taiwan to the West Coast?

Hi Guys

First off...

Extend the telescopic & put a squirt of WD40 onto a rag or kitchen roll, wiping the lubricant over the joints and gently open / close the antenna a couple of times - might save you bending / breaking it.

The wire antenna is.. just that ... so if you break or lose it, you can make one from speaker wire with a mono jack or try a spare junk cable from a junked pc speakers (cut junk speaker off & away)

You could put an inline jack on far end and plug in a longer home antenna when you return home or go camping etc as well.

I've found Chinese post to be super efficient - ie 2 days and item is in your country. Unfortunately here in the UK it takes an amazing extra 8 days to be processed.

1396. Re: KA 1103 fading in and out??

Look out for decent rechargeables..

The supplied batts were cheapo and , so I bought eight Profitexx
3200mAh batts - that way you can 'rota' from an external charger.

The 1103 is more sensitive, so noise would be more noticeable
(att on?)

noise near pc?
Try turning on/off your TFT monitor whilst listening...
ahaaaaa culprit???

cheers n beers

Mike

If your computer creates loads of hash, you can try putting a ground
wire to the pc case. (Old BBC micro pc's didnt even have metal cases
so we used metal spray and earth wires to reduce the RFI)

Laptops aren't so easy, but you will have 5mm Hex nuts on serial and
parallel ports - a wire under one of these would be to laptops earth.
(The proper tool to use is a Hex 5mm nutdriver or spinner)
Dont overtighten as the Hex head can break off

A wire wrapped under a Desktops case screw and down to earth or a
circlip around a metal water pipe might help. (NOT mains earth)

If the external power supply is rated 8 volts @ 300 milliamps, how can 4 AA cells be an appropriate power supply?

Should I just plan on cobbling together a suitable dc adapter?

Most DC Adapters are not well built(cheap !) In other words without loads (or if lightly loaded) it will show 8 volts BUT with NORMAL loads it will dropped down to somewhere arround 6 volts. If this is the case you are alright otherwise definately is not OK.

Guys, I am not sure if you know this but Eton sells the E5/G5 adapter that should work for the 1103. It works great on the G5 I have. Just FYI

1403. What kind of external antenna?

Yahoo group: de1103
Date: 2008-01-27 21:48:38 UTC
From: dogmarty
Topic: 1403 Message: 1403

I recently bought a Kaito KA1103. I bought a small "reel up" antenna too. I would like to go to the next level...a external antenna. I would like to place either something outside eve mounted, or better yet something in my attic. I own a 1 story ranch house... at sea level. Will an antenna up a additional 10 or 20 feet do much for me? What are my options? I understand I need an antenna that will not "overload" this little reciever. And how do I build an antenna and convert to the mini-plug jack?

Thank You in advance for your replies?

The wire I received with my Degen works well. Try a long wire with a
little tuner. You would have to try some setup but look, bigger antenna
big signals and sure overload.

I use a 25 meter long wire, with a 9:1 balun with a toroidal ferrite core (put when I used to listen with a Kenwood R600) and which is located at the near house end of the wire, there where the coax connects with the antenna, plus another balun added later when I purchased the Degen. This balun is a cylinder ferrite with a primary and a secondary properly connected, and is at the reach of my hand in the shack. I adjust the reception just to avoid overloading of the front-end.

Reception is superb, however my big problem is TV Cable or TV set interference on the lower bands (particularly 60 and 90 mb tropical bands).

1406. First Impressions

Yahoo group: de1103
Date: 2008-01-31 13:58:19 UTC
From: Gordon Cooper
Topic: 1406 Message: 1406

The radio was well-packed, certainly. No batteries included, but not a problem.

The first comment is that there's a radio station in Bremerton that overloads every other am radio I have so badly that most of the spectrum over 1100 is covered with this signal.

The 1103, on dx setting, is not overloaded. This is the quietist am radio I have had in my lifetime.

Found some cw on shortwave, along with wwv, of course, in the afternoon here in Bremerton. BFO was really excellent, and surprising to say, at least as easy to tune on most
stations as the R390 I used in the service, though of course the 1103 doesn't have the stability or sensitivity of that piece of formerly classified technology.

Getting home at night, the radio pulled in 660 am, a Midwestern Canadian station, like it was a local. Separation was superb between stations, as was clarity. I've never heard am like this since my long gone stereo Sony am portable radio some 23 years ago.

I do not understand how someone could think of the ergonomics of the 1103 as weird or difficult. This was an easy, almost intuitive radio to operate after a half hour of knob spinning.

FM was clear, amazingly good. This radio gets stations from Seattle that I've never been able to tune, even when I lived in there.

Cannot comment on shortwave, as the noise from the utility junction box on the outer wall of my apartment makes almost everything on shortwave impossible to listen to due to buzzing.

A great buy, an easy radio to operate, and it is about 40% smaller than I had thought.

That's strange that you didn't get any batteries. Mine came with 1300 mah and runs a long time on them. 2500 mah are common these days. You can buy four NiMh rechargeables for about $10.00. Did you buy the Degen or the Kaito?

The extremely low noise floor is part of why it works so well. The 1103 is the biggest bang for the buck. I bought a Sony ICF-SW7600GR about four months before my 1103. I very seldom use the Sony any more; mainly when I need the synchronous detection.

Enjoy!

Odd that you did get no batteries. Perhaps they
are trying to lower their costs even more... I
have two of them purchased by different ways and
both came with a pack of green Degen rechargeables.

I'm glad to hear that you are as satisfied with
the receiver as I am. MW DXing is hard in this
country were the band is crowded with local
stations, but I have been able to pick up the
Falklands on 530 without any external antenna (not everyday, of course).

On SW I have catched Papua New Guinea and Vanuatu
on the tropical bands with the telescopic antenna...
You can't ask for more for the price.

Mea culpa, amigos!

They were tightly taped to the inside of the plastic formed box, on the underside.

Ah well, the 2500 mAH batteries should almost be out of the charger tonight, and the Degen green batteries can get zapped overnight and ready for their next mission.

Glad you found them. I'm pleasantly surprised at how long they last. If you think 1300 mah is cheap my Eton E10, a radio that lists for $130.00 (and isn't worth it; no SSB) came with 1100 mah. They would not power the radio nor charge inside of it. They were .70 volts DC. I charged them in an external charger and they've been on their best behavior (charging in the radio) ever since.

The only reason I bought the Eton E10 because Fry's was selling refurbs for $30.00!! I didn't really need another radio but you know how that goes.....

Glad you like the radio.

Your review causes me to ask a question that has had me wondering for some time. I have had my 1103 for at least 3 years, with no problems other than the occassional flakey operation of the decoder.

But, there is one local FM station on 96.6mHz that is so strong that it blocks out the one that is at 97.7mHz. The local/dx switch does not seem to affect it. I have tried it with the antenna collapsed, which helps some, but it is not 100%. Does anyone have any suggestions on how to decrease the sensitivity on FM.

All in all, great radio.

That isn't a sensitivity problem, but most likely one of selectivity. The bandwidth filter is
just a bit too wide to distinguish between those stations. I am given to understand that there are places that can fit a narrower filter-maybe Kiwa could suggest a suitable fix. A narrower bandwidth means a narrower signal, so you lose some of the high frequencies.

Not really a problem if the alternative is not hearing the station at all.

My location is poor-the Seattle stations don't exactly focus on the Bremerton market. Getting fm at all is a marvel-my 5.1 Dolby system can't get a thing, and the DE1103 receives all of the Seattle stations.

From: E Zohn
Topic: 1415 Message: 1415

I'm new to the group and I've had my DE1103 for only a few days. It was purchased from an eBay seller located in China. Overall I'm very happy with my purchase. However the radio does not operate in the AC only mode, i.e., AC adaptor connected, batteries removed, as outlined in the ops manual.

In the AC mode the clock and light works. But the radio does operate when the power switch is turned on. It comes on and immediately switches off. The supplied power supply, P/N KA22D060030034C is rated at 110v/50Hz (?), 6v/300Ma.

Any help is appreciated .

I had the same exact problem with the DE1103 I ordered from China through eBay in early January. I also noticed with the supplied adapter that the supplied recharageable batteries did not charge at the rate described in the manual.

Once I replaced the AC adapter with one from Radio Shack, everything worked as expected.

I ordered the Degen 1103 from China through ebay and have noticed
the internal charger really doesn't really charge much. Using the
manual's calculation (1300ma battery divided by 100) I charge for 13
hours and when done the battery indicator only registers 1 bar. I
get MAYBE a day of use from it. Should I try a longer charge time
or should I just use a external charger ? I haven't tried the radio
through AC power only.

My DE-1103 from China also will not operate with the supplied 6 V PS sent

with radio. The radio will turn on and immediately off. Batteries, both Nicad's

which I charge in a separate charger work fine. Standard AA's also work fine.

I had another 6 V PS with 500ma and correct plug, it's works just great!

I can only assume the supplied PS from China does not have sufficient

MA's???

E Zohn <ezohn47@...> wrote:

Check that your local mains voltage is rated the same as the charger.

If the charger is rated 110V AC and you plug it into a 230/240V AC socket it will blow

if the charger is 230/240V AC and is plugged into a 110V socket it will probably not function.

Its good that I open and check the charger when they are new, The transformer secondary voltage is 6 volts when new, when my A/C adapter supply fail to charge the battery, and well not power the radio, I open and check the voltage on the transformer its below 6 volts, about 5.6 VAC, when the voltage goes in to the voltage regulator IC LM7806, it drops even more, under load its 5.8 volts DC this voltage was push up by the charging of the capacitor, when load is apply it drops to about 5.2 volt. so I took the transformer apart and found out that the magnet wire they are using have a poor quality of varnish, that it cause an internal short of about a turn, it did not burn the transformer because its design for 50 Hertz, If its design for 60 Hertz it will get very hot, when I rewineded the transformer with new magnet wire,it works great now, hope this help.

>group who could have another source other than 110v.

I live in a country where a 220-V power grid is
used. Both of my two DE-1103 came with 220-V
power supplies which bear the P/N
KA22D060030034C... the same part number reported by E. Zohn.

1) I find strange that two different power
supply models (one for 110 V and the other for
220 V) have exactly the same part number, but who knows

2) The 220-V version has flat parallel prongs
identical to those used in the US system, so it
is impossible to tell one from another unless one reads the label.

I think that it is not impossible for the
manufacturer to mislabel the unit and then the
user gets the wrong version. Chinese
manufacturers are not famous because of their quality control practices...

If you have access to a tester it would be
interesting to measure the DC voltage supplied by the adapter.

Hope this helps.

Yahoo group: de1103
Date: 2008-02-08 03:20:24 UTC
From: Travers
Topic: 1415 Message: 1426

The AC adapter that came with the radio will power my radio with AC power only (batteries taken out). So at least the included PS does that.

This has been a fun game in AC adapter stats. The included power supply is 110v ~ 50Hz input; 6V 300mA output. Now this differs from the DE1103 operation manual specification of 8V 300mA output for power. In the US AC adapters are 120v ~ 60Hz input which makes the included PS odd with 110v/50Hz.

In the end the included PS will power the radio from AC only but is no good for charging. I do have a spare Radio Shack AC multi-adapter that does 6 or 7.5V input at 300mA. I just need to find the correct sized tip to use it with the Degen 1103. I want charging damnit! :D

Thank you all for the replys to my request for help. I had a spare 6v 500Ma adaptor for testing. Turns out the adaptor is indeed defective. So that is good news. At least its not the radio. The repacement adaptor I ordered is reported to meet the DE1103 design spec output of 8v 300Ma. This unit should also take care of the charging issue. Again, Thanks....

"Supplied power supply, P/N KA22D060030034C is rated at 110v/50Hz (?), 6v/300Ma".

Glad to help.

I'm still fighting with mine. In my case the AC adapter might be fine but the batteries are defective. I tried charging the Degen batteries in a external charger and they still didn't hold a charge! Next test I'll use non-Degen rechargables and a non-Degen AC adapter to see if the radio charges. Funny though despite the battery charger probs the radio is still a steal at $50 (great performer!). I've been chronicalling the battery adventure on my radio blog.

If you want to eliminate one or the other, don't replace the batteries and charger at the same time because you won't know for certain which was defective.

1434. Re: AC operation

Yahoo group: de1103
Date: 2008-02-11 13:55:29 UTC
From: Travers
Topic: 1415 Message: 1434

In a previous post I said the AC adapter works (at least it powers the radio); it's the batteries that don't seem to hold a charge for any time. I'm still testing random things. I think the adapter just barely covers powering the radio (based on specs) and the Degen batteries are shot (since they don't charge anywhere).

1436. Power Issue and Positive Feedback on Radio and Component

Yahoo group: de1103
Date: 2008-02-13 04:56:39 UTC
From: Gordon Cooper
Topic: 1436 Message: 1436

I sent an email to Tao Qu (Radio and Component) about the 1103 needing a reset when putting in fresh batteries or when going from battery to ac power.

He called the factory and talked to the engineer there, and responded to my email in about five minutes. This is an occasional bug, but not a problem. Just hit the reset button.

Wow.

I know who my next four or five electronics purchases are coming from in China.

Gordon Cooper

I agree. This Seller is very friendly and efficient and I would
recommend him anytime.

I also found the postage stamps on the parcel most fascinating :)

A good simple antenna is LW 21 meters long or asymmetric dipole
WINDOM, for example: http://www.dxzone.com/catalog/Antennas/Windom/
(Carolina or FD4...). Just, I think, You do not need to balun.
Coaxial cable connect directly to the antenna.

I bought mine from liypn with a DE1103 in January, and yes, the radio does go in face down so the velcro closure is on the back of the radio. Because of the cut-out for the tuning knob, it cannot go into the case face up.

Not rying to be arguementative here, but is not "face down" relative. I open the flap towards me with the velcro closure in the back, slip the radio in, and put it down on a table. The radio stays "face up" or at least "face towards me" the whole time. The radio will go into the case either way actually. When I just went to look at mine, I had put it in the opposite way from what the design intends (face up?). I probably would have never even noticed had it not been for this thread.

The cutouts for the fine tuning wheel and light switch don't line up if you flip it over and the tuning knob is covered, but this doesn't make much difference. You can't use the radio when it is in the case anyway. There are no cutouts for the speaker and you can't see any of the display. The remaining cutouts and the uncovered tuning wheel can't do much good at this point.

I got the case just to protect the radio when I throw it in my suitcase or breifcase. For this purpose it works just fine. I figured out pretty quickly that I had to take the radio out of the case to use it, so it really doesn't make any difference as to how I put the radio into the case when I put it away.

I just looked at my Sangean ATS-909, my Eton E100 and E10. The flap on the case does fold towards the user on all of them when the front of the radio is facing the user. However, ALL of them need to be removed from the case for use. The E100 case exposes the tuning knob and maybe 25% of the speaker, but everything else is covered. I thought maybe I could use it with an earphone, with the radio remaining in the case, but the earphone jack is covered by the case.

In other words, I am not sure why one would worry about how the 1103 fits in its case.

Hi Dennis;
Yes, I've bought one of the carry cases. It's good value; nice and soft and protects the radio extremely well. You're right, the radio goes in face down, but it slides in and out of the case very easily. Be aware that it is really only a carry case - it doesn't have any cut-outs for speaker, dial and controls. To cater for the big LCD dial and range of knobs, the case would probably not be structurally strong enough to provide much protection. But as it is, it's a good, protective travel case, and that's all I really want.

The schematic is in the group's Files area. The reset button is in the small
hole marked RESET to the right of the on/off button.

1450. NEW MEMBER FROM PANAMA

Yahoo group: de1103
Date: 2008-02-21 04:35:36 UTC
From: Carlos Vargas Vidal
Topic: 1450 Message: 1450

Very dear fans of Degen DE1103:

My name is Carlos. I am from Panama. I was a ham radio operator when younger. But I have been a shortwave radio enthusiast since I was 15 years old. I am now 60.

My first good radio was a Grundig Satellit 6001. Later on, I had a Sony 2001D with a Sony AN-1. Finally, I had the Sony ICF-SW55. I did make very good dx.

Among other things, I enjoyed listening the Somoza's Army and the nicaraguan guerrilla fighting each other even across the hertzian waves. They used a lot of strong words.

I am about to receive the Degen DE1103 from eBay (sold by Mr. Tqu china). Therefore, I have enrolled as member of this fine group (thanks Mr. Leon). I have spent several days reading the messages. But I am not very clear about this:

1. How to avoid the static electricity getting into the radio thru the antenna. I understand I can ad some diodes to the antenna, but I would not like to make that mod right away. Also, I am not prepared to do that at this moment.

2. How to avoid resetting the radio after changing the batteries. I have planned to use some NiCad batteries I have because I have a charger. Besides, I have read that many of you prefer to use batteries.

Well, thanks so much for your kind attention to this message. Best regards to all, Carlos

Welcome to the group. Enjoy your new radio; it's quite a find for an inexpensive piece of equipment.

You might consider ham radio again. It's changed quite a bit in the last few years. There is ham radio in the International Space Station, ham satellites, and Internet connections. I've been a ham since 1956 and am still enjoying the hobby.

Hi Carlos, welcome to the group. I live in Uruguay and would like to share my experience of two years using this fine receiver.

Mine was bought in Spain, and it was sold to me tested, I mean, no problems of circuitry due to an eventual failure of the quality control at factory. It came complete 220/6V wall transformer, of good quality, didn't produce 50Hz hum. The batteries which are NiMH (not NiCads) Eton brand, an earphones set. Manual, etc..

The first things that focus your attention with this receiver are first, the way it changes the volume, you?ll find it strange to push the volume button plus moving the jog wheel. If you get an amplified set of speakers of those used in PCs (I got a 2.1 Genius) you'll find a nice and rich audio. With the use you'll tolerate this particular design, and the volume will be controlled with the outboard audio amplifier.

Second, you'll find an outstanding sensitivity in FM for this receiver. And very well set narrow selectivity for SW, and a good performer in MW.

Third, when you decide to connect an external antenna, it will be a problem to connect for instance 25 meters of wire without previous solving the coupling factor, since the receiver will overload. For this reason I constructed baluns (matching impedance transformers) for that, using a ferrite rod or/and toroidal core. It's better to place it at the near end of the wire, there where the far end of the coaxial cable is connected.

You can test with several turn ratios in order to get a proper transfer of the signal to the receiver without overloading.

See http://arieldx.tripod.com/estaciondx/proyectos/balun41.htm and

http://arieldx.tripod.com/estaciondx/proyectos/balun91.htm

for schematics of simple baluns, both of which are in use at my shack and which I've built. (I have the toroidal balun in the far end of the coaxial and a ferrite rod at the near end, close to my receiver.

In the meantime, if you use the telescopic antenna, try to not to play too much with it, it's delicate and I know several cases in which it has fallen.

Fourth, the static problem: avoid touching the telescopic antenna if you're in dry weather and anytime you can be careful with this issue. Your body maybe charged of static electricity anybtime you walk over a rug or playing with plastic bags, etc. specially in dry weather days and you could damage the FET front end RF amplifier which I believe is the heart and main reason of the good sensitivity the receiver has.

My practice is, when a strong lightning storm is near your QTH and more if it's over your house or quarter, disconnect the outdoor antenna, and also disconnect the receiver from the mains 220 V outlet. Moreover... I practice this every day when I leave home to go to work. No antenna connected and only using the batteries in receiver standby to keep alive the clock.

When I return home, before I connect the external antenna I touch the plug with my hands and touch the wall. This to discharge any presence of static in the antenna or coax. And I connect the wall ACDC converter.

In the bad moment you blow the front-end FET, try to get the replacement at eBay. Anyways, I have a good number of them I can provide to you in case you need, because I once experienced the fate of burning them one time when a lightning fell near my house. Those are the kind of lightnings that produce a slight change in the light bulbs and when you feel is the inevitable and precise moment you think you have to disconnect the PC modem or the cable TV connector from your TV set. The replacement of the FET was made by a friend of mine who professional works in servicing car electronic parts (speed meters, ec.) and who owns a controlled temperature soldering station. There are surface mounting components you have to deal!

Fifth, avoid using the detachable plastic lid in the rear. It's very nice, but fragile, as it happens with other receivers like the Sony 7600G or Grundig Yacht Boy 400, which also owned some time ago. Try to find a plexiglass angled piece or other substitute to put the receiver.

Sixth, recharge your batteries (I repeat I use NiMH) with an external charger and discard using the receiver's own option of charging them. You'll get faster and better results.

I sure you'll enjoy the receiver's fine performance regarding the low priced it is.

Finally, I discarded the original earphones. I purchased also in Barcelona, Spain, a pair of Sennheiser ones which I found much better.

Carlos, it's very cool you heard those war transmissions. Do you have some recordings of them to share as mp3?. I am very interested! And please share your comments on the Degen DE1103 when you start playing with it, and your first DX catches!

Now few words in Spanish...
Si quieres integrar la lista Yahoogroups donde estamos muchos sudamericanos principalmente de Argentina, Uruguay, Chile, Venezuela, etc. el nombre de la misma es Condiglist. Con mucho gusto tambien podemos conversar en Espa?ol via mi direcci?n e-mail personal.

>Dear Don: thanks so much for your info. When you say that batteries can be recharged without removing them from the radio, about what batteries are you referring to? The NiCad I plan to use or the NiHM that the radio brings with it. Please, pardon my english.

Mr Tao Qu wrote to me and told me I should use the NiHM batteries that the radio should use according to the manual. He added that he has sold some 2000 radios and he have not gotten any claim regarding the batteries/adaptor/resetting issue. I must believe him.

This morning I bough from La Casa del Teléfono (the only distributor in Panama of Radio Shack) an AC-to-DC Power Adapter. The catalog number is 273-025. It is a regulated and filtered adapter of 6V and 300mA. It cost $12.99 plus tax. I bought it because somebody wrote in these forum about the complains with respect to Degen AC-to-DC Adapter and charger.

Well, thanks so much again. Carlos

1459. Re: NEW MEMBER FROM PANAMA

Yahoo group: de1103
Date: 2008-02-22 02:45:26 UTC
From: Carlos Vargas Vidal
Topic: 1450 Message: 1459

Dear Horacio: this is the second time I write this letter. The first one got lost while writing it. Please, pardon my English (though I studied hotel management in USA, in New York, the Big Apple, back in 1974, I forgot how to use the language properly; but I have not forgotten NY. Ja, ja), nevertheless, I will try to answer you long letter from the beginning to the end. Thank you, by the way for your time, it shows me you cared a lot about me and my radio hobby. May God bless you!

I travelled to Chile (Santiago, Viña del Mar and Valparaíso) but I never went further. I know I have missed a lot. I have heard very nice things about Argentina and Uruguay.

It is a very good idea to have an external speaker. Specially such as the one you mention, with an amplifier. Unfortunately, I can not afford to buy many things now. I do not have a steady job. Hotel owners believe that, at my age, we are obsolete. Ja, ja. But I found a cure for the speaker. I have one from Radio Shack (#21-549B), from the "old times". It is 8 ohms and 5 watts device. I will plug it to my DSP Noise Reduction System, also from the "old times". It is a computer controlled (#21-543) digital signal processor. It is not reviewed very well by eHam, but it worked perfect for me. It has a built-in audio amplifier and speaker. But it also has an outlet for an external speaker. The right place for my speaker mentioned above. The DSP circuit dramatically reduces heterodynes and background noises from incoming signals. So, it is specially good for the tropical bands and around. The device can be used with small radios since the max audio input level is 3 volt peak-peak. As long as I have the right audio input and can play with the signal.

I bought the radio (not yet, it is not with me. Ja, ja) for his sensitivity and selectivity. Thanks for giving me the news that the radio is indeed sensitive. In our region, with transmitters with low and very low power, this is a must. I also have a cure for that. I do not believe in complex and big antennas for the small portable radios. I just think they were not built to handle that. I did buy a 30 feet long wire, 16 awc, stranded and enamel (I forgot the jargon of ham radio operators). I did not buy a thicker wire normally used (12 or 14 caliber) because mine is more manageable. And I will plug it to an Amplified Shortwave Antenna from Radio Shack (#20-0280). It is also from the "old times". The device has a 20 dB gain which compensate the lack of the 10 db gain that are lost thru the external antenna outlet of the radio. But the most important thing, specially for the small portables radios, is the Tuning Knob. It does act as a preselector. It also has an RF Gain Knob which takes care of the overmodulations and so on. So you can see, Horacio, I am more o less

well prepared to receive my Degen DE1103 radio.

With respect to the static problem I bought this morning from La Casa del Teléfono, the only distributor of Radio Shack, here in Panama, a bunch of diodes 1N4148. I told the owner of the store, a friend of mine, that I was looking for some diodes for the antenna. I never mentioned him the part number. He looked around and gave me the package with the right diodes. I think he knows too much, ja, ja. I have now 10 diodes for the amount of $2.85 plus tax. If somebody wants a couple of them, I am willing to mail them at not cost. YET, Mr Tao Qu just wrote to me. He said he has sold 2,000 radios and never heard of any complain about the Q stage of the radio. He also assured me that this problem was fixed. I wrote to him that I must believe. After all he is a straightforward person. But, as you know, Horacio, there are many risks in life. You never know when a defective part infiltrates equipments. So, keep for me those FET transistors you said you purchased. I really hope I never have the need to use them.

Thanks for the info about the back lid of the radio. I will try to get a cheap plastic stand as soon as I can. By the way, I also owned the Sony ICF-7600 G, but I gave it away. I never got accustomed to the up and down tuning and muting. Imagine, I had the Yaesu FRG-7 and was so charmed o delighted about the many knobs it had. It was so good to spend some time looking for a radio station. The real and biggest problem was that it was always impossible to have a more precise frequency number. So, I gave up.

With respect to the batteries I will appreciate that you read my message to Don. I mentioned him several important things. I bought this morning, before receiving an email from Mr Tao Qu, an AC-to-DC adapter from Radio Shack (#273-025). It is regulated and filtered. The output is 6 volts and 300mA. I only hope that the adapter and charger from Degen be in very good conditions, the same with the batteries that come with the radio.

I also have a cure for the earphones. I have from the "old times" a pair of headphones from Radio Shack (#20-210A). They have a good review from eHam and were used by many radio enthusiasts. They remind me of the headphones that the air pilots of World War I used, ja, ja.

I do not have any recording of those war episodes. It is a pity. I heard many things that are not known by many persons, except those involved. But is everything comes out well I hope I can have some good catching. There is a very hot area in our region: Colombia and Venezuela. I used to hear the Colombian Army before. I also heard some very strange communications. I could swear that they came from drug traffickers and guerrillas. If I get to hear those I will certainly post them in the right forum. And of course, I will let you know. One thing I miss is not to have those big antennas the US Armed Forces had in Panama many years ago. I knew them because I got to be

a Night Manager of a US Air Force Open Mess. So I travelled across several military bases.

I will check the yahoo group you mentioned me in Spanish. I was member of the American Shortwave Listeners' Club, based in California. Some of the members belong now to a yahoo group. I understand that there are other nice web pages like the one directed by Glen Hauser.

Horacio, thanks so much for your kind attention. And I hope I have also been helpful to this fine group.

Best regards to all,

Carlos Vargas Vidal

Even if you can get the CPU from the manufacturer(check the Degen website) you still need sophisticated equipment to re-program it. Sorts of mission impossible.
Sounded like an excuse rather than admitted they do not know how to fix it.
May be others in this group can help. Good luck.

Many Thanks!

There is a due sellilng these defective de1103 on eBay. His latest is one that has power but no sound. If interested go to ebayand type in defective de1103. He is in Illinois. If I get interested I may purchase one from mainland China or stay satisfied with my Sonty ICF2001 or whatever the model number is.

Thanks! I brought the de1103 to a shop and they say it needs a cpu replacement which is unavailable in Thailand. Can anyone give me more information on this CPU?

1464. Degen DE1103 arrives in Panama

Yahoo group: de1103
Date: 2008-03-01 04:51:34 UTC
From: Carlos Vargas Vidal
Topic: 1464 Message: 1464

Hello, everybody. I hope your are fine.

Finally, the Degen DE1103 arrives today, february 29. What a day? I have tested and it seems it is working OK. For a quick look I found R. Rebelde (from Cuba) on 600 kHz, 0300 UTC, very clear with a baseball game. Also, WBOH, a 50 kW station, on 5920 kHz. In english and with some bible commentaries. The signal was not as good as R. Rebelde but it was very clear.

I am using an L inverted antenna (homemade) of about 15 feet (my balcony can not afford a longer wire). Plus an amplifier from Radio Shack and a digital processor from the same company. The built-in antenna is very good, but there is no doubt, the ouside antenna with the amplifier do a better job, of course. I do not hear so much noise with the built-in antenna but the digital processor reduces somehow that noise.

I changed 3 times the batteries and I did not have to reset the radio.

Strangely, I received today a small AM Loop Antenna from Sony. I did not expect it today. It is plastic and 4 inches all around, more or less. It has 8 turns of wire and two ends. I put it close to the radio but nothing happened. I understand this antenna was used with Sony Stereo Radios. How can I make it work?

Well, very best regards to all of you, and thanks for your comments. The radio was purchased from Mr Tao Qu. It took 13 days to arrive here in Panamá.

Chao,

Carlos

Hallo Carlos,

I hope you like the 1103.

The AM-loop with a 3.5 mm mono jack connected to external "ANT" of the 1103 gives no changes in signal strength.
Connected the same loop to a Sony ICF-SW7600g gives less signal strength.
This AM-loop is not for portable radio's I think.

From: Horacio Nigro
Topic: 1464 Message: 1467

An external antenna acts for the DE103 in MW when the "below 100 kHz reception mod" is done. Acc to past posting (Message #295) in this group:

"Trick Tune below 100KHZ (If you want to)

You will be able to switch off ferrite bar ant. and use the wip or external.

Put in 21951 khz press am +
Press am fm together and start searching downward to below 100 khz.

Once you are below 100 stop the scan and store the frequency (you can go down to 000 and save it. Start from there) then pull it back up from the memory bank and turn off the radio. When you turn the radio on start turning the dial.You will be on the whip.

You can check your progress by placing your hand on the ant.I like to go down towards the am stations. By using the whip or external you should be able to hear many more stations."

1470. Avia & 2m bands

Yahoo group: de1103
Date: 2008-03-14 11:27:08 UTC
From: wind_nv
Topic: 1470 Message: 1470

Hello evryone!
There are some interesting things on the www.radioscanner.ru (Russian web site)
1103 has mirror channel about from 112Mhz to 148Mhz.
So, if you install a mirror pre-amplifier with band pass filter, you will able to receive Avia band and radiohams in 144-146Mhz, though 1103 has AM detector only. AM detector excellent recieve FM modulation.
You can also improve sensitivity main channel 0.1-30Mhz, magnetic antenna and make standart 50Ohm impedance for the external antennas connector.

1471. RE: [de1103] Avia & 2m bands

Hi,
Good news indeed, thanks for the information.
It's just a pity this russian site only speaks ... russian and there is no information in another language !
I found on www.radioscanner.ru some months ago very interesting pages in English concerning DE1103 modifications but I can't find them any more.
If somebody has any information how to get the English version, it would be kind to drop a line to the group !
Thanks in advance

1474. Re: Avia & 2m bands

Yahoo group: de1103
Date: 2008-03-15 15:51:49 UTC
From: wind_nv
Topic: 1470 Message: 1474

The scheme of the amplifier:
http://www.radioscanner.ru/uploader/2007/preamp4de1103i.gif

Author of the idea is ats52 that is member of
the www.radioscanner.ru

TV1 is like:
http://www.radioscanner.ru/uploader/2007/wba1.gif

1-2 =5 turns
3-4= 11-19
5-6=1

The ferrite ring has u=400. May be 400-1000.

VT1 is similar to the BFR93A

View inside:
http://www.radioscanner.ru/uploader/2008/avia_144.jpg
http://www.radioscanner.ru/uploader/2008/knopka_de1103.jpg

The schem of the install:
http://www.radioscanner.ru/uploader/2008/input_de1103mod.jpg

 Note: Output SA1 has to connect to transfomer (B1) of
mixer after(!) C134.
See the schem of 1103:
http://www.radioscanner.ru/files/degen/
Degen DE1103 - ... (main board)

You should also expand a range of frequencies.
for >30MHz :

1. Turn on the receiver and tune its on 21951 kHz (2-1-9-5-1-
«BAND+»).
2. Press simultaneously two buttons: «BAND-» and "BAND" until the
moment of the beginning of scanning downwards on frequency.
3. Stop scanning by pressing of any button, then press button " BAND "
and keep it until the beginning of scanning upwards on frequency.
4. Wait until frequency is above 29950 êÃö and stop scanning.
Write down frequency of a stop in any cell of memory.
5. Select the written down cell of memory by button " M/F " and pass in
a mode of manual tuning by repeated pressing of this button. On the
display there will be a frequency written down earlier, and an
inscription «MEM» in the right part of the display will be
replaced on «VOL».
6. Start scanning upwards on frequency pressing and holding of button "

BAND ". Scanning will pass a boundary of 30 MHz (indications on the display will become type like «b0000» where the first symbol ☐ the turned letter). Attention: it is necessary to have time to stop scanning on indications of the display between «b0001» and «b0009» (30.001-30.009 MHz).
7. Now by encoder it is possible to tune above up to 40Mhz. After a stop of scanning tune by encoder on any frequency above «b0010» and write down it in a cell of memory for the future use.

For example, 33860 MHz seems as b3860.
Mirror frequency is 33860 + 55845 (intermediate frequency) *2 = 145.550 MHz.

My experience:
...planes on a distance up to 200 km,
VO-52 sattelit 145.9 Mhz.
(It has been used external antenna)

With the best regards from Russia and sorry for my English. :)
73!

1478. One more carrying case

Yahoo group: de1103
Date: 2008-03-16 19:26:57 UTC
From: olefrijole
Topic: 1478 Message: 1478

Saw the previous posts on the carrying case from Ebay liypn. This after I went to Walmart on Saturday (I got the radio on Wednesday) and bought a camcorder bag made by Caselogic. The main compartment has an adjustable partition, is just the right size to keep the radio upright and allows me to close the case with the whip extended. Why? I like to listen to EWTN in sleep mode at bedtime (you'd think I'd get a nightstand). I tune in, set it to sleep mode, lock the control panel, plug in the earphones and set the case down on the floor by the bed.

The padded case has extra pockets which accomodate the manual & quick-ref guide, the AC adaptor and the MP3 player I won at work. One thing I noticed about the '1103 is that:

--it does fit in the front pocket of my workpants,
--carrying it by the included strap is unwieldy,
--when I hold the radio I find my fingers on the back and my thumb pressing on the large LCD display.

Joe

> You can also improve sensitivity main channel 0.1-30Mhz, magnetic
> antenna and make standart 50Ohm impedance for the external
antennas
> connector.

50 Ohm impedance.

Last DEGEN's versions (MKIV) have an external connector that switches
the telescopic antenna and an external antenna to the input of the Q1
amplifier.
It is not good. External antennas often overload the Q1.
So...
First, it is necessary to change an ext antenna input as it was in
old versions. See de1103_main.jpg in files.
For example:
http://www.radioscanner.ru/info/radio/degen2/014.jpg
http://www.radioscanner.ru/info/radio/degen2/015.jpg
and remove C1 on the board.

After that, install R=200 Ohm to B1 (mixer) between G input of the
Q7 and Q8.
It can result to loss of sensitivity.
But, It can result to low noise.
The sensitivity can be improved by the way installation of an
additional transformer between the pass filter and B1 (between
L110,C132,C134 and B1).
The transformer has 10 turns laid in three wires on a ferrite ring
with u=400-600. The schematic:
http://www.radioscanner.ru/uploader/2007/trr_degen1103.jpg
1 - input (from L110,C132,C134, see de1103_main.jpg in files)
2 - to ground.
3 - output to B1 1:2
4 - output to B1 1:3
If it is used out 1:2, then it is necessary to install R=1 kOhm to B1
between G Q7, Q8.
If 1:3, then R=1.8 kOhm
.. because, the transformer transforms impedance.

Input impedance will be 50 Ohm.

> You can also improve sensitivity main channel 0.1-30Mhz, magnetic
> antenna and

Magnetic antenna.

If it has been installed a resistor to mixer (see my previous post),
it should be installed an emitter follower after the MA amplifier Q14.

1. Remove D2.
2. Take any hf n-p-n transistor.
3. "Base" pin of the transistor connect to the output MA ampl. (where
was anode of the D2)
3. "emitter" to R111,D3,C107 (where was D2 cathode).
4. "collector" - to "cold" pin of L107,R107,C of Q3.
5. The transistor is set on side of the details in place D2

1481. Re: New file uploaded to de1103

A few questions if I may:

First, what is the significance of the Radio Scanner column?

Also, what is the source of this info? It would appear the newer unit is less sensitive at lower frequencies (higher numbers) but more sensitive at higher frequencies. Is this the result of an actual design change or just a differnce in alignment or performance of two specific units tested?

IOn ohter words, can we rely on this info to apply to ALL old versus new units or night it be only a smaple difference?

Thanks,

Jay

Considering that the DX-398 and ATS-909 are identical radios, I wouldn't put any credibility to the so called rankings below by the radio hobbyist from China ... Furthermore I have a hard time believing that the Degen DE1103 performs worse than the DX-398/ATS-909 on shortwave.

Not sure but my interpretation is when switched the DE1103 to the Radio Scanner mode(automatic station searching mode) we need stronger signals to "locked/stored them" to the memories. (i.e. This column is therefore shown less sensitive)

> Also, what is the source of this info?
Sorts of the Russian translation as memtioned by someone in this forum.

It would appear the newer unit
> is less sensitive at lower frequencies (higher numbers) but more
> sensitive at higher frequencies. Is this the result of an actual
> design change or just a differnce in alignment or performance of
two > specific units tested?

Again not sure but likely some components values(the band pass filter front ends) changed and peaked the freq at the higher freq.

> In ohter words, can we rely on this info to apply to ALL old versus
> new units or night it be only a smaple difference?

Not necessarily --- This Russian website is sorts of QST/e_Ham websites and should not be related. Am a DE1103 2006 model happy owner and not in a position to verify if these data is reliable. Use you own judgement nevertheless but I hope others can verify.

PS Again, a lab test result under controlled conditions may not garantee if those New or the Old models are better or worse in the REAL worlds.

--- Your milage may VARY ! Hope this helps.

I agree. I own both a DX-398 and a KA1103. I think the DX-398/ATS-909 is very much overrated if using the built-in antennas only. However if you use external antennas it becomes a nice radio, but not as good as my KA1103, which I am very happy with.

1486. Recharge time help wanted

Yahoo group: de1103
Date: 2008-03-20 04:04:48 UTC
From: olefrijole
Topic: 1486 Message: 1486

I received the KA1103 last week and recharged for the first time. With the supplied green batteries I figured 11 hours to recharge based on the manual's calculation (1100 mAh at 100 mA).

Is this typical for this type battery?

Would I be better off using alkalines?

Can I use a recharge unit from WalMart?

Your help appreciated.

Joe

If you think that's bad my Eton E10 came with 1100mah. If I'd paid full price ($130) I'd have been unhappy. However I got a refurb for $30 so that didn't bother me too much. The E10 is not worth $130. No SSB!! For $20 more you can get a E5/G5.

Thanks.

This morning while waiting for a new tire installation I saw some nice
units by

Duracell® and Energizer® with larger capacity AA cells.

1492. DEGEN UNTIL NOW...

Yahoo group: de1103
Date: 2008-03-21 07:48:53 UTC
From: Carlos Vargas Vidal
Topic: 1492 Message: 1492

Hello, everybody,

I have the Degen DE1103 for about 3 weeks. It is working Ok in FM, AM and SW. I have not tested the LW band.

I catched a station from New York (Radio Edición Cristiana Internacional)located at 530 Khz. It was clear enough to understand everything I heard. I also catched Radio Rebelde from Cuba at 600 Khz and Radio Progreso from the same country at 690 Khz. I will find out how strong they are. It is easier to catch station from my neighbor country Colombia, but they are, mostly, weak stations. Low power.

I think my biggest catch in shortwave was Radio Prague at 7,345 Khz and only 100 kW. There was a parallel broadcasting at 6,200 Khz. All of these stations were listened after 8:00 p.m. my local time. Or 0100 UTC.

I have been using a small inverted L antenna. Only 15 feet. With the same type of wire as lead-in and without any antenna tunner, except a kind of an old preselector and amplifier from Radio Shack. It dit helped a great deal. But I noticed I was picking up all kind of noise, no intermodulation.

Today I decided to use my old, but in very good condition, RadioMaster P-30 antenna. I did not use it before because it ends with a PL-259 plug. The antenna is working much better than the inverted L antenna, in spite that both have almost the same siza. But this antenna has a coaxial line as lead-in. It also has a matching transformer that ensures 50 Ohms impedance. The noise has been reduced, I guess, to the normal condition. I bought this antenna from Universal Radio. It is in stock but it is a little more expensive.

I bought a cheap (can not afford more for the moment) chinese battery charger for NiHm. It has an output of 240 mAmp. I still use the green batteries and four other from China, Tecman, 1800 mAh. They cost me $2 apice in a local chinese electronics. I noticed that one of the battery was exausted so I returned. I charged them and used them. But I noticed that one of the batteries was below 1.0 volts. So I charged it for 3 "seconds" using a 12 volts adapter. The voltage went up to above 1.0 volts. This means that the battery is OK and can be used. I learned that from Internet. I can upload the file. There is also a web page that deals with batteries in a very good way. That is complete.

I used the same formula from the manual to charge the batteries. But I always got a little more than 1.2 volts in each unit. So, I am using a new formula found somewhere else. It multiplies the result of the first formula by 1.5, and I get more voltage, around 1.3 volts. But, I am still unhappy. I just can listen the radio for about 4 hours. There is

no doubt that one must buy good quality batteries, but they are very expensive here. And they will be much more expensive if I bring them from USA to Panama. I would like to know what is the voltage you get after charging the batteries. The green ones and the chinese ones shows 1.2 volts on the label.

I did the mod suggested lately by the good friend Horacio. That is, goind down to below 100 Khz and stop somewhere there and store that frequency. But I have not noticed any increase in sensitivity. Can anybody explain to me a little more about this? Well, thanks so much to all of you and happy Easter.

Carlos

Sorry for my bad english

Did you use an external antenna to pick up New York stations in the MW band and where are you located? (somewhere in South America ?)
Please beware if you hooked up the DE1103 with any outdoor antenna Thunderstorms/lightenings may ruin/BURN your DE1103 frontend (please review others inputs in this forum for details.)
Regards.

From: Carlos Vargas Vidal
Topic: 1492 Message: 1494

NO, my dear colleague. I was in bed (could not sleep) around 5:00 a.m. (local Panama time. 1000 UTC) when I listened the radio station. The real name is Radio "Visión" Cristiana Internacional. Sorry for the mistake. I was kind of sleepy. BUT, I have been informed by a radio commentator from Miami, Dino Bloise, that I really heard the relay station located in Turks & Caicos. I am not so happy now (Ja, Ja) but, anyway, those islands are near Dominican Republic.

Thank you for your warning. No problem. I always disconect radios from antennas.

I forgot, many, many years ago, when in Panama, there were not so many medium way stations I used to hear WABC from New York.

Take care and may God Bless you,

Carlos

In the first place I also checked no such station (or any other New York stations is operating on this freq. --- all stations started from 540 not 530Khz) in New York.
Now the mysteries resolved ! Thanks nevertheless.

Thats correct

The relay station is on 530khz. I hear this station loud
and clear here in Palm Beach Gardens Florida.

You should really try am dxing starting the evening and
night also an am loop antenna one from terk would
be very useful in pulling in weaker stations sometime
attenuated inside steel conrete buildings that some
people live in like condos..and apartments.

Paul

NO, my dear colleague. I was in bed (could not sleep) around 5:00
a.m. (local Panama time. 1000 UTC) when I listened the radio station.
The real name is Radio "Visión" Cristiana Internacional. Sorry for
the mistake. I was kind of sleepy. BUT, I have been informed by a
radio commentator from Miami, Dino Bloise, that I really heard the
relay station located in Turks & Caicos. I am not so happy now (Ja,
Ja) but, anyway, those islands are near Dominican Republic.

Thank you for your warning. No problem. I always disconect radios
from antennas.

I forgot, many, many years ago, when in Panama, there were not so
many medium way stations I used to hear WABC from New York.

Take care and may God Bless you,

Carlos

From: Carlos Vargas Vidal
Topic: 1492 Message: 1497

Yes, amigo Paul, it is a relay station. I had the intention to write to Knyuen88 before to let him know that I heard the station again this morning (several times). When it was 6:00 a.m. local (Panama - EST) time an announcer said: (in spanish) "This Radio Visión Cristiana Internacional. It is 6:00 o'clock in the morning IN NEW YORK. Our station is WVIP, etc." I could not catch the rest. But he mentioned other stations in different places.

I was so happy when I heard it for the first time because the station mentioned several places in New York for Bible Gathering. And the names: Queens, Bronx and Brooklyn were very familiar to me.

After receiving the email from Knyuen88 I searched the station in Internet. It is in the following address: www.radiovision.net

The information is in spanish. I do not know if there is an english page (probably no, because the station broadcasts in spanish). Under programs it says: "WVIP 1310 AM Mount Kisco, New York. 530 AM Turks & Caicos <Caribe>". So, it is, in fact, a relay station.

Thanks for the advise about the AM Antenna. I have that in my dreams for the moment. In the mean time, I am catching many am stations using my RadioMaster P-30 Broadband Antenna.

Best regards,

Carlos

olefrijole <kd5czm@...> wrote: I received the KA1103 last week and recharged for the first time. With the supplied green batteries I figured 11 hours to recharge based on the manual's calculation (1100 mAh at 100 mA).
Is this typical for this type battery?
Would I be better off using alkalines?
Can I use a recharge unit from WalMart?

Your help appreciated.

Joe

hi joe
you can charge the batteries for 13 hours by the radio. but this may shorten the battery life because one or more battery may be overcharged. I recommend that you may buy a smart charger that charge each battery seperately and stop charging the indiviual battery automaticaly when it is charged cmpletly.you may buy sanyo eneloop charger that charge 4 batteries but it woks only with 110 v ac the other sanyo charger that works with 110 v ac or 220 v ac does not charge batteries seperately .

Never miss a thing. Make Yahoo your homepage.

In LW/MW bands (from 100 to 1600kHz) Degen1103 receives on the builtin magnetic antenna. The telescopic antenna and its amplifier don't work (they are turned off).
But, when you do mode below 100kHz, then listen to LW/MW, the magnetic antenna is turned off and the telescopic antenna is turned on. (For more details, see the schematic diagram).
So, sometimes it might be better sensitivity in LW/MW, sometimes no. It depends on different conditions.

From: olefrijole
Topic: 1501 Message: 1501

Has anyone tried using a pillow speaker with the KA/DE1103? Earphones and earbuds as supplied with the radio work for awhile but then turn on your side and I have to prop up my bone-head to keep the earpiece from digging further inside.

If you use a pillow speaker, what brand/model/type do you have? How well did it work for you?

Your help appreciated.

1503. Kaito KA1103 arrived

Yahoo group: de1103
Date: 2008-04-02 00:38:12 UTC
From: bob_bald1
Topic: 1503 Message: 1503

UPS just left having dropped off the Kaito KA1103 I bought from radios4you (no affiliation). I had wondered if the Kaito models reflect the same revisions advertised by eBay sellers of the Degen DE1103. Per knyuen88's great thread here and the links he provided I easily confirmed that in fact the US distributed Kaito branded version reflects all the outward manifestations of the revised model. Mine was S/N AI 057xxx. Now I didn't open things up so I don't know what markings are on the circuit boards.

I'm exploring the features and setting things up (clock, etc) and intend to do some BCB AM DXing with it this evening. More to follow.

I did some AM DXing last night both bareback and with a CCrane twin coil ferrite. Results were quite good, generally comparable to my FRG-7. My ICF-SW77 is being repaired and won't be available for comparison for 4-6 weeks. I will say that I like the backlight (the Sony goes off automatically with no provisions to keep it on) and the combi digi-analog tuning dial. I do miss the sync detector and tone controls of the Sony. The KA1103 speaker's audio quality isn't the best. Once I set the volume to a more comfortable level it retains that setting. I had misunderstood and thought it would default to "40" ever time I turned it on ...not so thankfully. The range of each individual band is somewaht confusing as the scan function covers less than the band limits. For example if you want to go to LF you can punch in 100kHz in the AM band and go there. But normal band scanning will stop at 530kHz for the low limit. I'm still breaking the code as to what the "real" ranges are for each band. I wish there were a ready reference :(

From: bob_bald1
Topic: 1503 Message: 1508

When I checked the UPS tracking information and knew which day the KA1103 would be delivered, that morning I charged up a fresh set of NiMh AA batteries.

Last night they died. I have been using the radio a lot but with the AC adapter plugged in most of the time. Duh. After some quick checking I found the adapter is a dud. Dead. Doesn't do squat. A Sony I had on hand with the proper specs worked with the KA1103 just fine, confirming the prognosis.

So I've e-mailed radios4you and await their response. I also have the unit registered with Kaito USA for warranty. We'll see....

I did receive replies that indicated the issue would be resolved but
my son also came up with a spare wall wart of the proper configuration
so the issue is now moot.

1510. Re: First "issue"
